

# i-Vu® Building Automation System Microsoft® Exchange Scheduling

Part Number: ADD-SCH\_EXCH

The Microsoft® Exchange Scheduling add-on integrates Microsoft Outlook® room reservations with Carrier's i-Vu® building automation system.

The Microsoft Exchange scheduling add-on uses the Microsoft web service API to read Outlook room reservations from the Microsoft Exchange server. As Outlook room reservations are read from the Exchange server, they are written as schedules to the i-Vu building automation system. They are then used to operate heating, cooling, and lighting systems in the room based on the desired schedule, promoting optimized comfort for occupants and energy savings for building managers.

## Application Features

- Allows the building automation system to be scheduled using Microsoft Outlook
- Keeps occupants comfortable by turning on HVAC and lighting systems when rooms are in use
- Promotes energy savings by keeping room temperatures within a specified range during occupied and unoccupied periods
- Supports OAuth 2.0 and Basic authentication

## Requirements

- Requires i-Vu Pro 7.0 or later user interface with latest cumulative update
- Licensed Microsoft Exchange Scheduling add-on version 2.0 or later
- Exchange Server for Office 365 or Microsoft Exchange 2010 or later with a service mailbox
- Exchange Web Services (EWS) must be enabled on the Microsoft Exchange Server
