# i-Vu® Pro Cloud Security Policy

Rev. 9/12/2025

## Overview

At Carrier®, system and operational security is integral. To ensure the security posture of products and offerings manufactured at Carrier, research and development teams leverage the domain expertise of our own world class secure architecture domain experts to design for security and continuously analyze, identify, and improve our offerings. Carrier's processes and standards ensure the appropriate methods and controls are applied proactively through all phases of the development and product support lifecycle. Rigorous testing and analysis capabilities are continuously implemented to ensure our products meet and exceed international standards of cybersecurity assurance, and Carrier's own demanding requirement for customer mission success. The Carrier Way also ensures that customers and end users are responsibly supported for cybersecurity assurance throughout the life of our offerings.

## Security Team

Our team is comprised of highly experienced and credentialed veterans; diverse and dynamic cybersecurity domain experts who have maintained prominent roles and responsibilities in designing, building, and operating highly secure complex systems at companies ranging from startups to large public companies.

## Cybersecurity Principles

Carrier endeavors to adhere to the following security principles in every product, offering or service development, deployment, support and/or maintenance activity:

- Application and implementation of the appropriate proactive and reactive security controls is a necessity throughout all phases of the Secure Product Development and Support Lifecycle, in accordance with industry standards and best practices for cybersecurity, and in a manner that ensures Carrier and customer mission success.

- Processes and support services shall align with and, where possible, exceed appropriate industry best practices, codes, and standards, in a manner that transcends fundamental security maturity norms in a manner that ensures Carrier and customer mission success.

- Security requires teamwork, situational awareness, domain expertise, context, collaboration, transparency and continual analysis, improvement, and vigilance.

- Comprehensive identification and proactive management of all cybersecurity risk in a repeatable and consistent manner is foundational to support the Carrier standard for security maturity.

- World class capabilities, practices and activities shall be maintained in the cybersecurity domain areas of secure deployment, threat intelligence, monitoring, and cybersecurity incident response, to consistently provide responsible and effective cybersecurity channel support and transparency.

# Technical Security Standards

The i-Vu Pro Cloud application provides a very high level of security to protect against unauthorized access. This memorandum briefly outlines design, security, configuration, and implementation aspects of your i-Vu Pro Building Automation System Cloud application.

- i-Vu Pro source code is subjected to source code analysis and independent third-party penetration testing as part of our software development lifecycle process.

- All third-party libraries are scanned for known vulnerabilities.

- i-Vu Pro web server engine:

  - The i-Vu Pro Cloud application uses its own built-in web server engine based on a locked-down version of Apache Tomcat. This greatly reduces the chance of an undiscovered Apache Tomcat vulnerability.

  - The i-Vu Pro Cloud application does NOT use Microsoft's IIS web server.

  - The web server renders only i-Vu Pro pages. It cannot be used as a general-purpose web server to render pages from other systems on the building network.

  - All database queries use a single internal interface that protects against common SQL injection attacks.

  - The i-Vu Pro Cloud application does not use Java® Applets or Java Web Start.

  - The i-Vu Pro Cloud application allows only add-on applications provided and signed by Carrier.

- i-Vu Pro Cloud communication:

  - **Client/Server** is communication between the end user's computer and the i-Vu Pro Cloud application.

  - **Server/Gateway** is communication between the i-Vu Pro Cloud application and the Carrier IP controller over BACnet/SC through a BACnet/SC connection or over BACnet/IP through a VPN tunnel.

  - The i-Vu Pro Cloud application uses the ports and protocols listed in the following table:

## BACnet/SC

| Port | Transfer | Protocol/User | Use |
|------|----------|---------------|-----|
| 443 (default) | TCP | HTTPS (Web server) | Client/Server |
| 4443 (default) | TCP | WSS (secure WebSocket for BACnet/SC) | Server/Gateway |

## BACnet/IP through VPN Tunnel

| Port | Transfer | Protocol/User | Use |
|------|----------|---------------|-----|
| 443 (default) | TCP | HTTPS (Web server) | Client/Server |
| 500 (default) | TCP/UDP | IPsec/IKEv2 (secure Tunnel for VPN) | Server/Gateway |

- The i-Vu Pro Cloud application does not require open ports for standard Telnet, FTP, Windows file sharing, or other applications that can increase the vulnerability of the system.

- Built-in support for Transport Layer Security (TLS 1.2+) communication provides state of the art encryption for all communication to ensure unauthorized 'eavesdroppers' cannot obtain passwords or other sensitive information passed between the web server and client. All network traffic between the i-Vu Pro Cloud application and the browser can be encrypted using a locally created certificate. The i-Vu Pro software suite offers tools to recreate these self-signed certificates at any time, export to a third-party Certificate Authority (CA) and re-import the signed certificate. After you receive and install a signed certificate, be sure to back up the certificate and keystore.

- IPv6 is supported between the i-Vu Pro Cloud application and the browser through a BACnet/SC connection.

- The BACnet Secure Connect (BACnet/SC) protocol allows the i-Vu Pro Cloud application to securely connect to remote sites. This protocol uses secure WebSocket connections and Transport Layer Security (TLS 1.3) with mutual authentication to ensure the confidentiality, integrity, and authenticity of all messages transmitted across the connections. Support for PKI and X.509 certificates enable strong security for communication within the BACnet/SC network.

- The Virtual Private Network (VPN) protocol allows the i-Vu Pro Cloud application to securely connect to remote sites. This protocol uses Internet Key Exchange (IKE) to establish a secure, authenticated communication channel between 2 parties. Support for IKEv1 and IKEv2 allows for secure VPN negotiation, remote hosting, and network access.

- The i-Vu Pro Cloud application provides the additional security features of Amazon Web Services (AWS):

  ○ Guard Duty—threat detection that monitors for malicious activity and unauthorized behavior

  ○ Web Application Firewall (WAF)—configured to protect against the most common web threats

- Operator access to the i-Vu Pro Cloud application:

  ○ i-Vu Pro password security allows operator access based on privileges set by the administrator. The advanced security policy provides further security through password character/expiration requirements and user lockouts.

  ○ Access to the i-Vu Pro Cloud application can be restricted based on geographic assignment of operator privileges. For example, this allows persons with the same operator privileges access to different geographic areas of the system (i.e. two different rooms, floors, or buildings).

  ○ The i-Vu Pro audit log provides a detailed list of all operator actions and can be searched by operator name, date, and geography.

  ○ The i-Vu Pro Cloud application can require an operator to record the reason for a change to operating conditions before accepting the change.

  ○ i-Vu Pro Cloud operator passwords are "salted" and "hashed" using SHA512 and therefore cannot be reversed-engineered and are not exposed if the i-Vu Pro database is compromised. This also means that Carrier cannot help recover lost passwords.

  ○ Passwords that the i-Vu Pro Cloud application uses to access other systems use AES-128-bit encryption. This includes database passwords and Email and Write to Database alarm action passwords.

- All patches to the i-Vu Pro software are signed for authentication and to prevent tampering.

- Database servers are configured to allow access only by the i-Vu Pro Cloud application and tools.

- See our *Security Best Practices* document for a security checklist.
