SMART MANAGER /
CENTRAL REMOTE CONTROL

SERVICE MANUAL

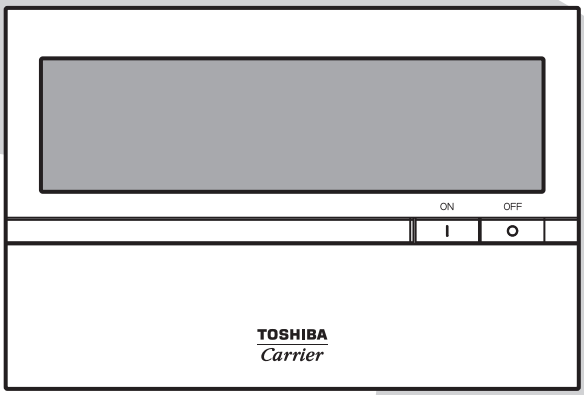
Model name:

SMART MANAGER

BMS-SM1280HTLUL

CENTRAL REMOTE CONTROL

BMS-CM1281TLUL



PRINTED IN JAPAN, Sep. 2012, TBLS

Contents

SAFETY PRECAUTIONS

Important safety-related information is described on the product and in this Service Guide.
Read the following description on labels and symbols carefully and follow their directions.

[Explanation of labels]

Label	Explanation
⚠ DANGER	Indicates that the repair engineer and other third-party individuals in the vicinity may be exposed to immediate risk of death or serious injury if operation is not performed correctly.
⚠ WARNING	Indicates that the repair engineer and other third-party individuals in the vicinity may be exposed to a risk of death or serious injury if operation is not performed correctly.
⚠ CAUTION	Indicates that the repair engineer and other third-party individuals in the vicinity may be exposed to a risk of injury or that property damage (*) may result if operation is not performed correctly or from failure of product after operation.

(*): Property damage means expanded damages to assets, furniture, livestock and / or pets.

[Explanation of symbols]

Symbol	Explanation
	Indicates prohibited activity Specific prohibited actions are described in statements near the symbol.
	Indicates enforced action Specific enforced actions are described in statements near the symbol.
	Indicates caution (includes danger alert and warning) Specific content of caution is indicated in a picture or statement near the symbol.

⚠ DANGER

 Turn off breaker	**Turn off breaker before performing work.** Otherwise, one may receive electric shock from the high-voltage electricity, resulting in death or injury.
 Prohibition	**Do not turn on the breaker when the cover of the unit is removed.** Otherwise, one may receive electric shock from the high-voltage electricity, resulting in death or injury.

⚠ WARNING

 Check for ground wire	**Before fault diagnosis or beginning repair work, make sure that the ground wire is connected to the ground terminal of the unit.** If not, ground leakage may result in electric shock hazard.
 No alteration	**Do not alter the product.** Components of the unit should also not be taken apart or altered. Otherwise, it may result in fire, electric shock or injury.
 Use designated parts	**Use designated parts for replacement.** Using parts other than those designated may cause fire or electric shock.

⚠ WARNING

 Restricted area	**Do not allow unauthorized personnel other than repair engineers to enter areas where fault diagnosis and repair work is conducted.** Unauthorized persons may suffer injury from tools and disassembled parts.
 Insulation	**Connect lead wires with crimping terminals and turn the closed end upwards to avoid exposure to water.** Failure to perform this post-connection treatment may cause disasters, such as electricity leakage and fire, on the client's premises.
 Assembly wiring caution	**After repair, ensure that the assembly of disassembled parts and the connection and wiring of removed wires are completed so as to restore them to their former state. Be careful not to have the internal wires caught in the cover or other closures.** A defect in assembly or wire connection may cause disasters in the client premise, such as electricity leakage and fire.
 Insulation check	**After repair, check for insulation between the charged part and non-charged metal part (ground terminal) using an insulation resistance tester (500 V) and ensure at least 2Ω resistance.** If the insulation resistance value is low, it indicates the risk of disasters, such as electricity leakage and electric shock, on the client's premises.
 Electric shock caution	**In case of performing circuit inspection while the circuit is connected to a power source (if such condition is necessary), use rubber gloves and other measures to prevent contact with the charged part.** Otherwise, one will risk electric shock from contacting the charged part.
 Check after repair	**Upon completion of repair, ensure that there are no abnormalities.** Risks of fire, electric shock or injury may be prevented by inspection. Turn off the breaker before performing inspection.
	Test run the system after repair and make sure that there are no abnormalities including smoke. Risks of fire and electric shock may be prevented by inspection.
 Repair and Reinstall	**Repair and reinstallation must be performed by qualified professional.**

⚠ CAUTION for Monthly Report Creation Software for Smart Manager

- Using the accumulated power meter with pulse output, this system calculates the distribution of the accumulated power converted from pulse signal by the load ratio estimated for each air-conditioner. The result can not be used for official purpose as the calculation is not based on the local Measurement Act.
- Even though operation time is the same, power consumption varies depending on operating conditions such as the installation condition of the air-conditioner, the set temperature, and the outdoor temperature.
- The air-conditioner is powered on for protection, etc. even while stopped, and power is consumed. This system also calculates power consumption while the air-conditioner is not in use.
- This system calculates the distribution of the power by load ratio estimated for each air-conditioner. The result may differ from the actual power consumption.
- As the distribution will be calculated from total power consumption if a single power meter is installed for multiple air conditioners, the result may be different compared with the case power meter is installed for each air conditioner.
- This system calculates the pulse output from the accumulated power meter with pulse output. The result may differ from the actual power consumption depending on the accuracy of the power meter, especially on the low power consuming condition such as operation OFF.
- Please note that we bear no responsibility for any damage or trouble that occurs due to this system's distribution calculation, data loss, etc.
- This system only supports the distribution calculation of power consumption by the air-conditioner. Above conditions have to be agreed for the use of this software.

1 PRODUCT OVERVIEW

This product is an air-conditioning control system to control and monitor the operation state of air conditioners in a building by using a computer with the mouse at a customer site. The system enables intensive management, operation control, and energy-saving operation for the air conditioners of up to 128 groups. The display and operation are available on a Web browser. This does not require dedicated software to be installed in a PC, and enables up to 4 units of PC to access simultaneously the system.

1-1. Main Functions

Monitoring / Controlling Air Conditioners

Enables users to monitor the operating status, setup status, and error status of all their air conditioners, to start and stop all theirs air conditioners, and change the setup details of all their air conditioners.
The air conditioners are named and categorized in a hierarchy by each floor, tenant, area, and air conditioning system. When controlling the air conditioners, they can be set in batch by each floor, tenant, or area, or they can be set individually for each air conditioning system.
The air conditioners can be controlled by linking to the locking signals.

Scheduled Operation for Air Conditioners

Operation of all air conditioners can be scheduled. Up to 10 setups can be programmed for each day, and it is possible to prevent users from forgetting to switch off by setting a stop schedule. During scheduled operation, users can set the Power status (On / Off), Operation mode, Temperature setup, Remote control operation restricted / allowed, and Return back.
In the master schedule, users can set weekly schedules and five types of special day schedules, as well as monthly schedules for up to 12 months.

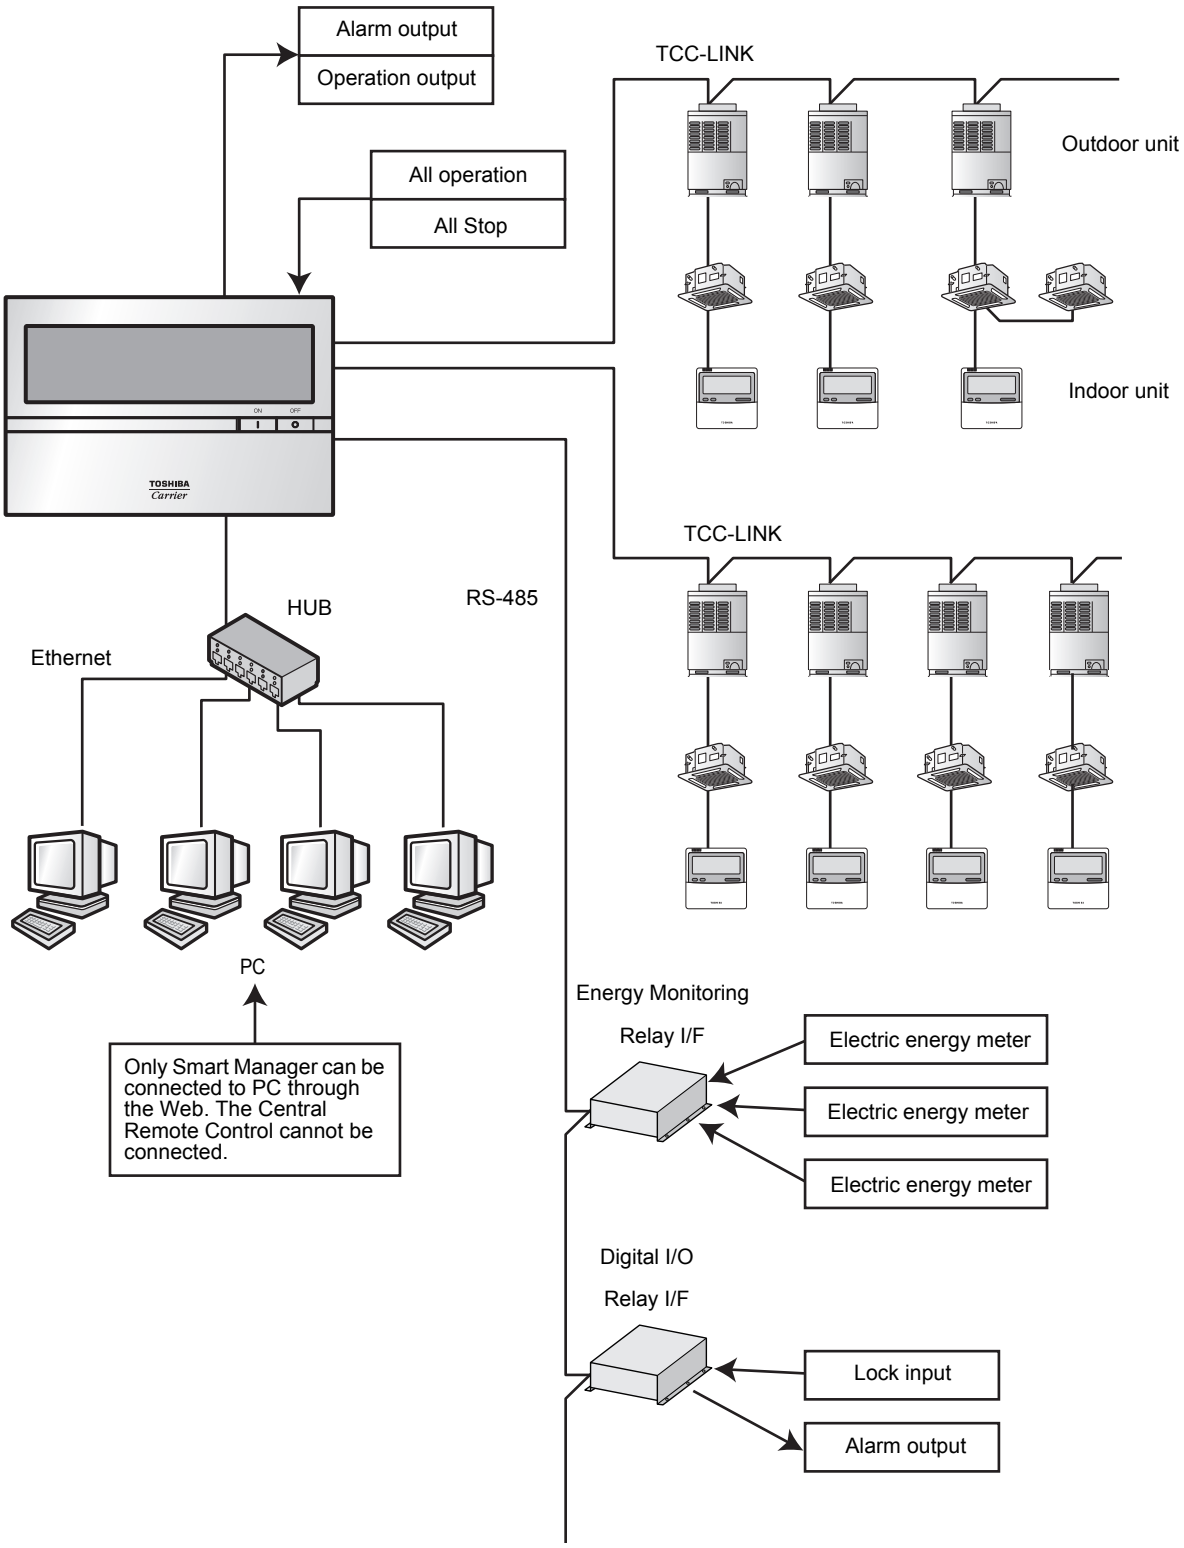
Distributing Power used by Air Conditioners

It is possible to distribute the power to be used for each air conditioner. In the billing schedule setup, it is possible to monitor the operation time period and power distribution during both working hours and non-working hours separately.
Note that power distribution requires the Energy Monitoring Relay Interface (sold separately).

Warning List

Displays all current warnings in a list. Warning history is also displayed in a list.

2 SYSTEM CONFIGURATION



System Devices Configuration

Device Name	EXTENDED SYSTEM		
	Model	Number of Units Connected	Remarks
Indoor Unit	(TCC-LINK based model)	Max 128	Up to 64 units per line Up to 128 units in total for 2 lines
Energy Monitoring Relay Interface	BMS-IFWH5UL	Max 4	Up to 8 electric energy meters per BMS-IFWH5UL
Digital Input / Output Relay Interface	BMS-IFDD03UL	Max 4	Up to 8 lock inputs or fire alarm inputs per BMS-IFDD03UL
Central Remote Controller	BMS-CM1281TLUL	Max10	—
Client PC	(Windows based model)	—	Up to 4 units for simultaneous access

Client PC spec	OS	Windows XP, Vista, 7
	Browser	Internet Explorer 6.0 / 7.0 / 8.0 or Firefox 2.0 / 3.0 / 3.5 / 3.6
	Display	1,024 X 768 more

2-1. Communication Specification

TCC-LINK	Topology	Bus
	Signal wire type	2-core shield wire
	Wire size, length	AWG16 (1.25 mm^2), up to 3200 ft (1000 m) (Total length) AWG14 (2.00 mm^2), up to 6500 ft (2000 m)
	Number of nodes	Up to 100 (Total of Indoor unit, Outdoor unit, Central Remote Controllers and Interfaces)
	Transmission rate	9.6 kbps
	Polarity	Not exist

RS-485	Topology	Bus
	Signal wire type	2-core shield wire
	Transmission distance	Up to 1600 ft (500 m) (Total length)
	Number of nodes	Up to 32
	Transmission rate	115.2 kbps
	Polarity	Exist

Ethernet	Network interface	10BASE-T / 100BASE-TX (Auto sensing)
	Transmission rate	10 M bps (10BASE-T) 100 M bps (10BASE-TX)
	Transmission media	For 10BASE-T: Category 3 or Category 5 For 100BASE-TX: Category 5 (*)
	Straight / Crossover	Use a straight or crossover cable depending on use.
	Length	Maximum segment length: 320 ft (100 m)
	Connection	RJ-45 connector

(*) LAN cable: Unshielded twisted pair (UTP)

3 LIST OF FUNCTIONS

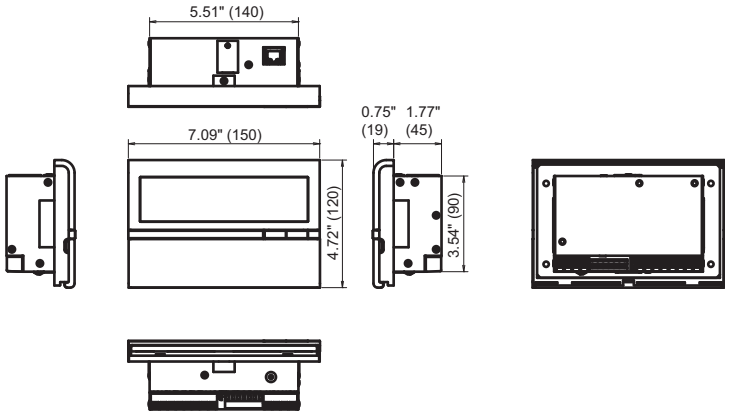
4 PRODUCT SPECIFICATION

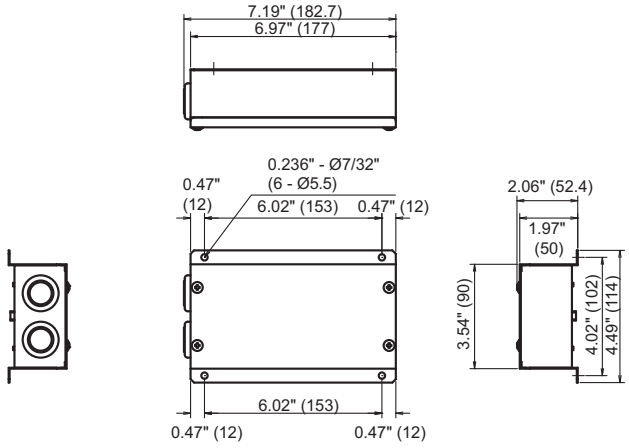
■ BMS-SM1280HTLUL (SMART MANAGER) BMS-CM1281TLUL (CENTRAL REMOTE CONTROL)

Central Controller



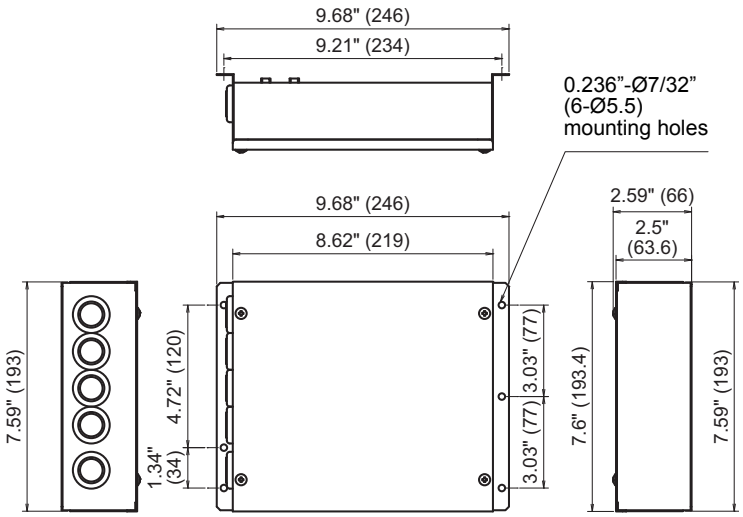
Power supply	Use the supplied power unit.
Power consumption	
Operating temperature / humidity	32 to 104 °F (0 to 40 °C), 10 to 90% RH (no condensation)
Dimensions	4.72” (H) x 7.09” (W) x 2.52” (D) inch (120 (H) x 180 (W) x 64 (D) mm)
Mass	1.77 lb (0.8 kg)

Power Unit



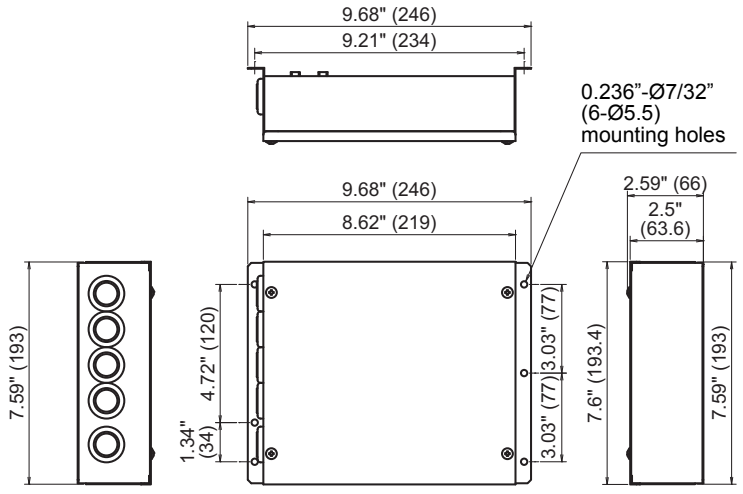
Power supply	120 VAC, 60 Hz
Power consumption	6 W (SM1280) / 4 W (CM1281)
Operating temperature / humidity	32 to 104 °F (0 to 40 °C), 10 to 90% RH (no condensation)
Dimensions	4.49” (H) x 6.97” (W) x 1.97” (D) inch (114 (H) x 177 (W) x 50 (D) mm)
Mass	1.99 lb (0.9 kg)

■ BMS-IFWH5UL (Energy Monitoring Relay Interface)



Power supply		120 VAC, 60 Hz
Power consumption		3 W
Operating temperature / humidity		32 to 104 °F (0 to 40 °C), 10 to 90% RH (no condensation)
Storage temperature		-4 to 140 °F (-20 to +60 °C)
Dimensions		2.59" (H) x 7.59" (W) x 9.68" (D) inch (66 (H) x 193 (W) x 246 (D) mm)
Mass		2.98 lb (1.35 kg)
Power meter input	Power meter input	Photo-coupler insulation
	Input points	8 points
	Input resistance	3 k ohm
	Input "ON" current	3.6 mA
	Input pulse condition	50 msec or more

■ BMS-IFDD03UL (Digital Input / Output Relay Interface)

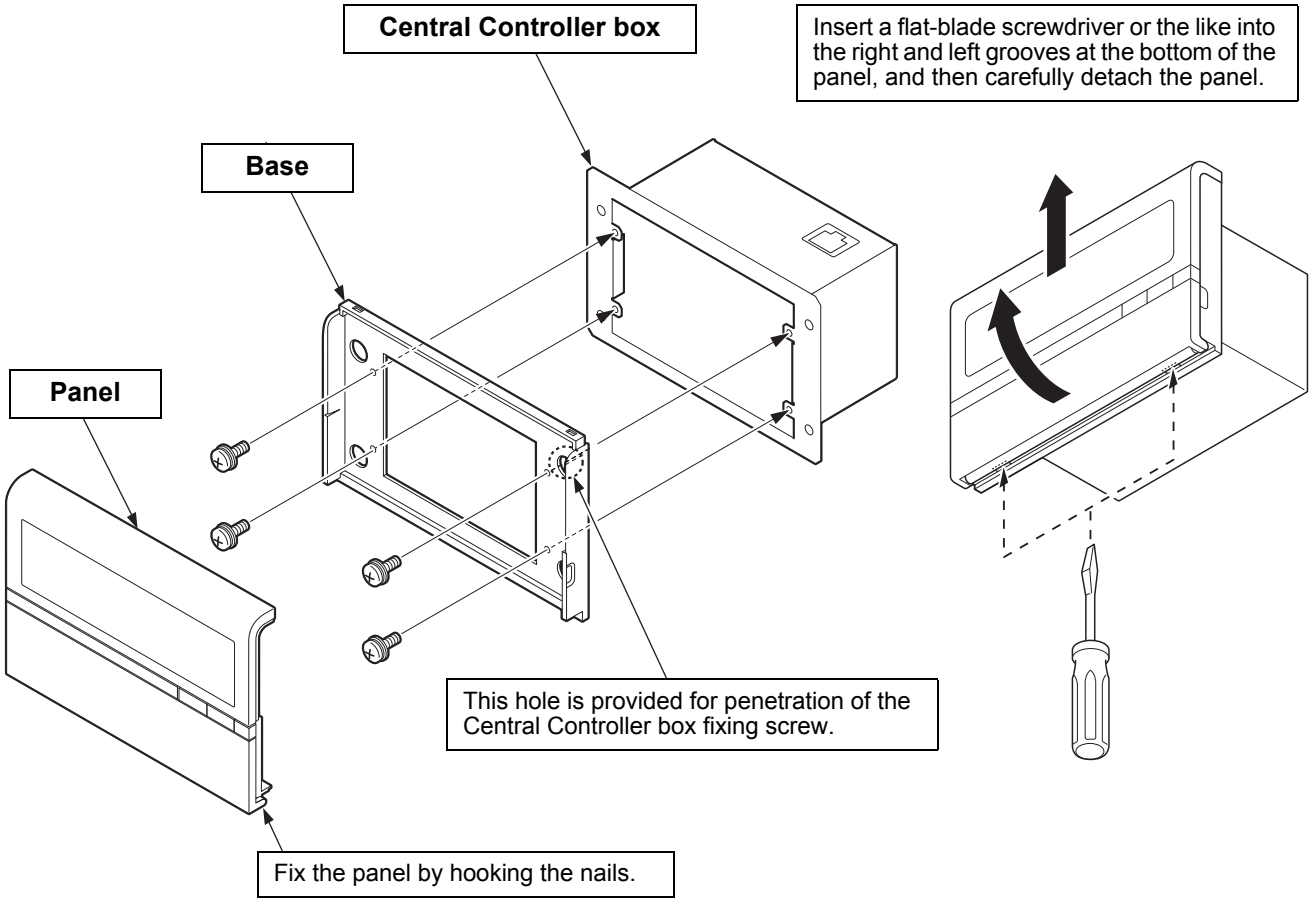


Power supply		120 VAC, 60 Hz
Power consumption		5 W
Operating temperature / humidity		32 to 104 °F (0 to 40 °C), 10 to 90% RH (no condensation)
Storage temperature		-4 to 140 °F (-20 to +60 °C)
Dimensions		2.59" (H) x 7.59" (W) x 9.68" (D) inch (66 (H) x 193 (W) x 246 (D) mm)
Mass		2.98 lb (1.35 kg)
Digital input	Input type	Photo-coupler insulation
	Input points	8 points
	Input resistance	3 k ohm
	Input "ON" current	3.6 mA
Digital output	Output type	Open collector
	Output points	4 points
	Output current	Max. 35 mA (per point)
	Output voltage	Less than DC 24 V
External power supply for Input / Output		DC 12 V, 90 mA

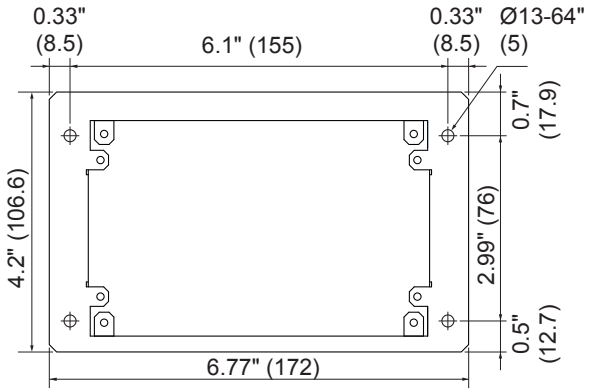
5 INSTALLATION OF THE Smart Manager / Central Remote Control

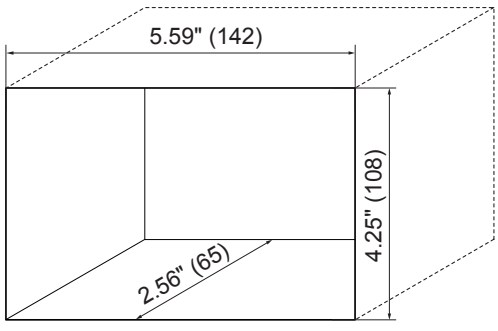
⚠ CAUTION

- Do not twist communication wires (used between indoor unit and outdoor unit and used for central control) and input / output wires with power wires or bundle them together with power wires in a metal tube. Doing so may cause malfunction.
- Install the Smart Manager / Central Remote Control away from a noise source.
- When noise is induced into the power supply of the Smart Manager / Central Remote Control, take proper measures such as attaching of a noise filter.



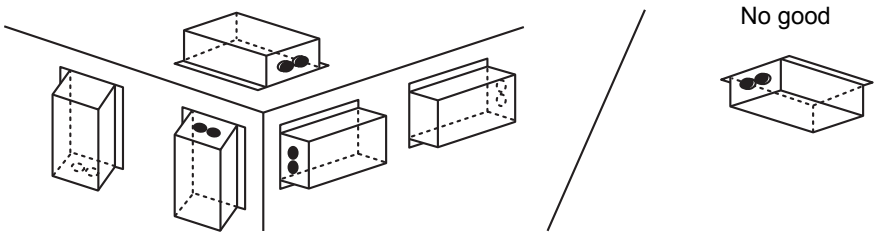
Dimensions of unit fixing holes in the wall, etc.





■ Power Unit Installation Method and Orientation

There are five installation methods for this power unit as shown below: surface mount and wall mounts. Use the attached screws.



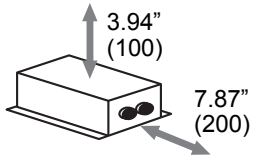
REQUIREMENT

Do not install the unit in any of the following places.

- Humid or wet place
- Dusty place
- Place exposed to direct sunlight
- Place where there is a TV set or radio within one meter
- Place exposed to rain (outdoors, under eaves, etc.)

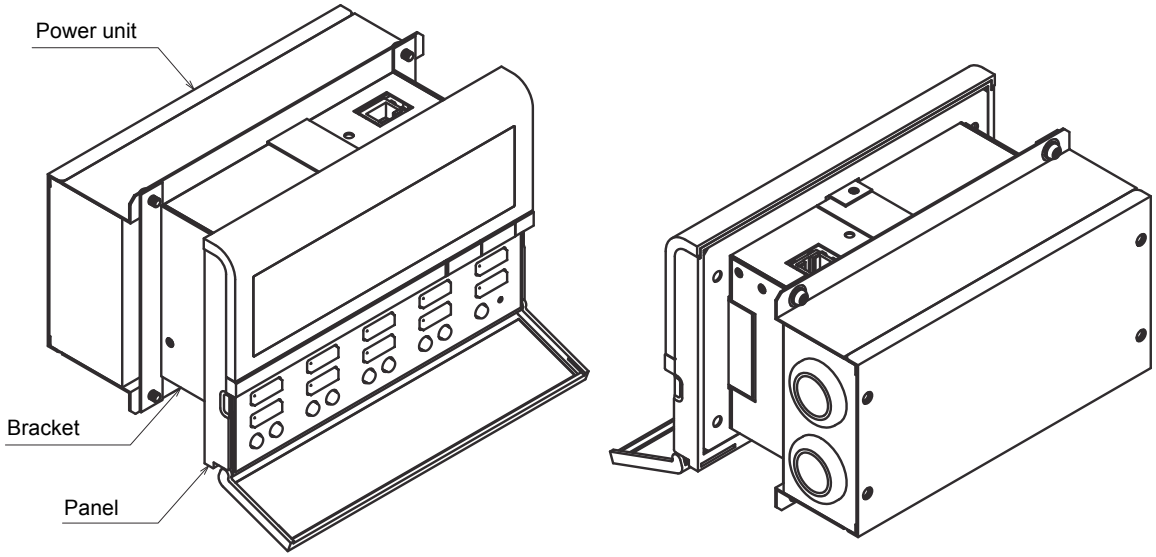
■ Installation Space and Maintenance Space

A side space for connecting through cable inlets and an upper space for maintenance must be reserved before installation.
The other sides can be adjacent to surrounding objects.

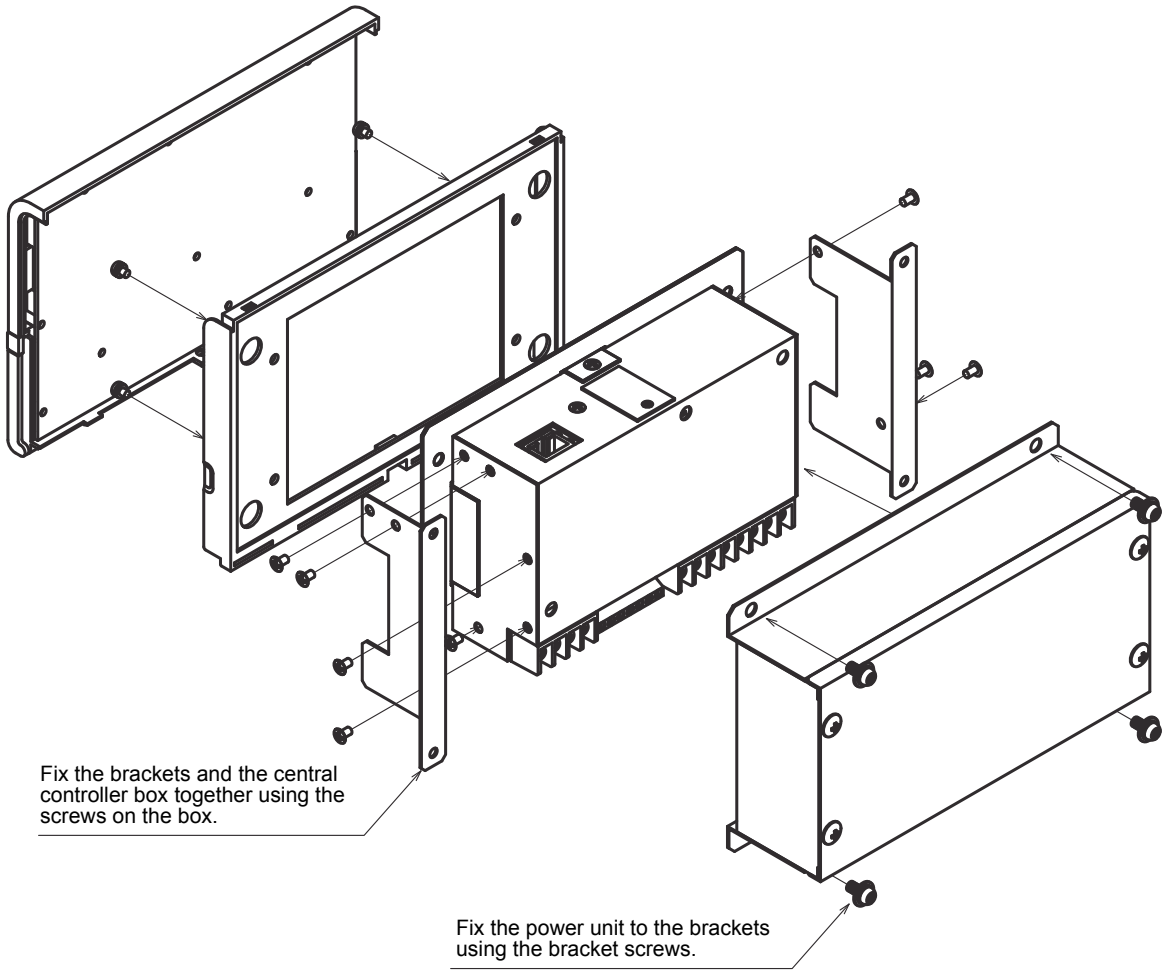


■ Combining the Central Controller and Power Unit

You can combine the central controller and power unit using the supplied brackets as follows in order to control them as one unit



Combination method

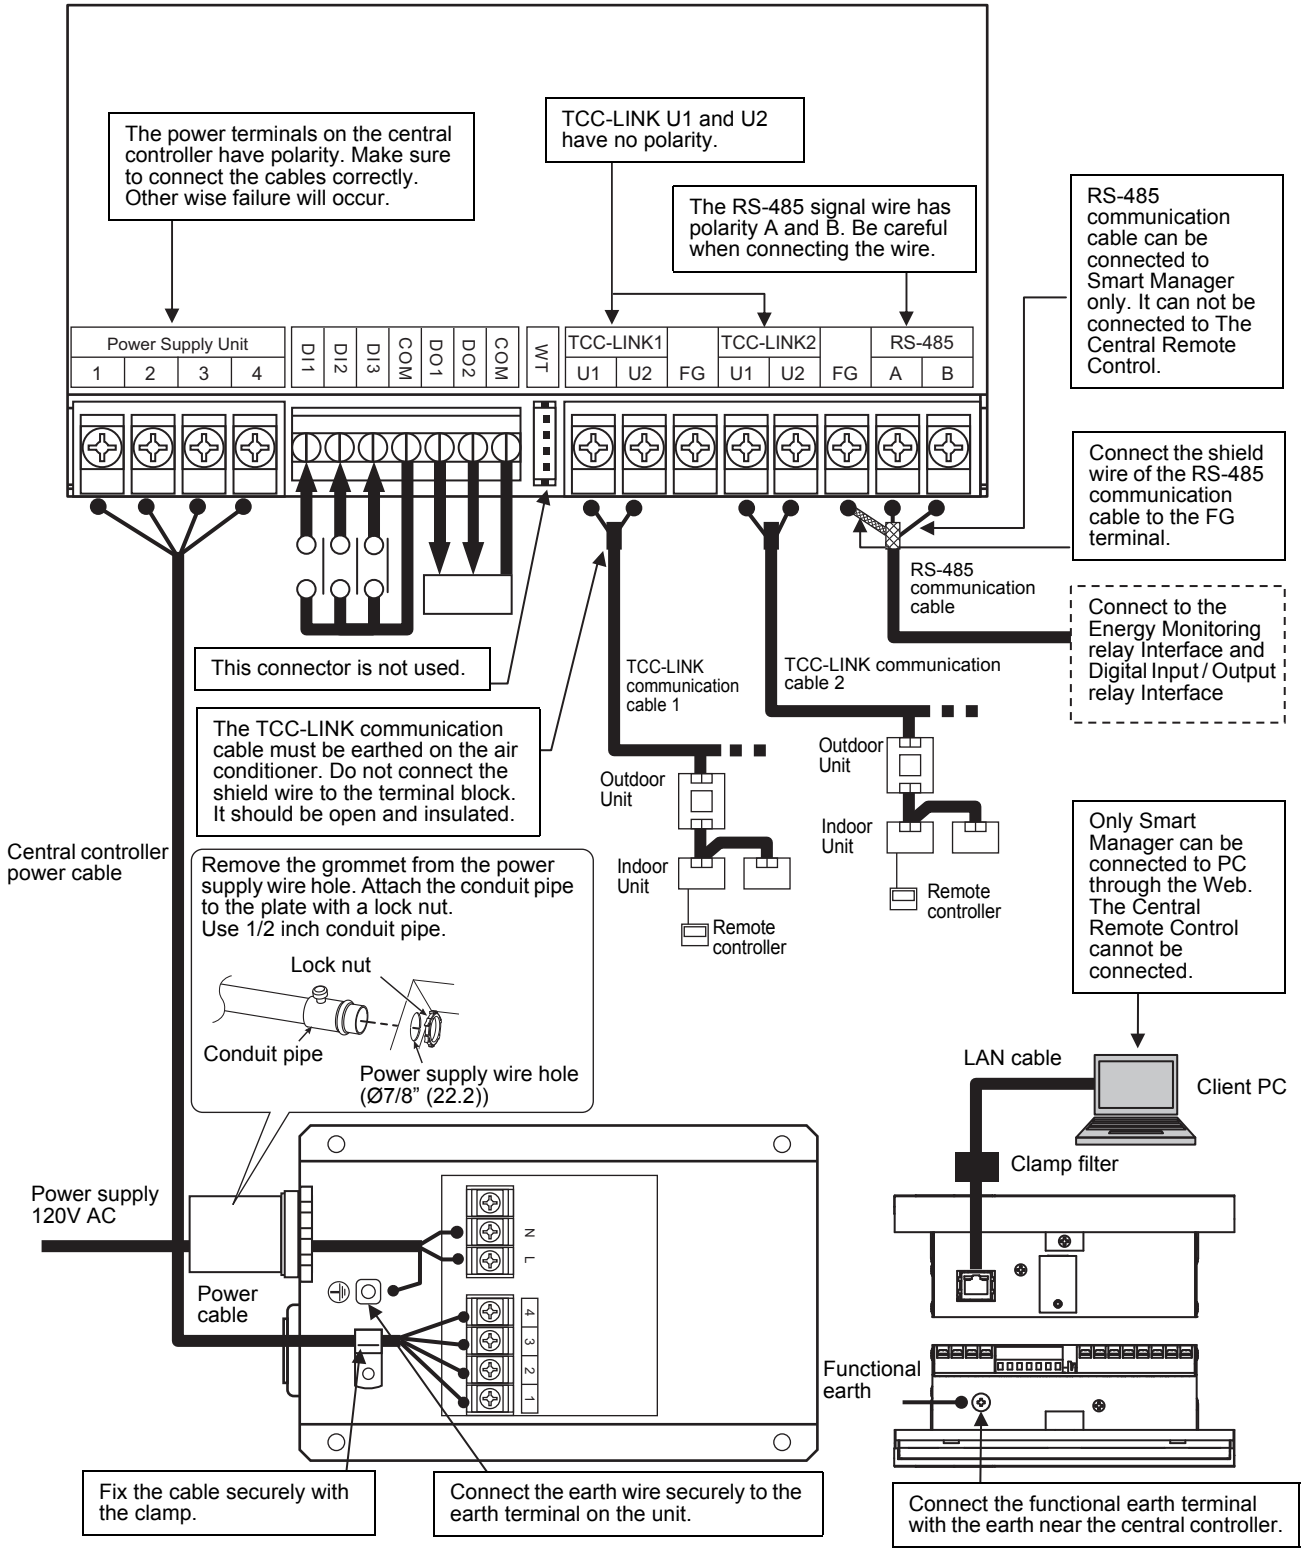


6 CONNECTION OF POWER CABLES / EARTH WIRES / COMMUNICATION CABLES

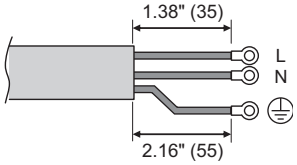
Connect power cables, communication cables, and earth wires to the specified terminals on the terminal block.

REQUIREMENT

Attach a ring tongue terminal to the end of each wire except those for digital input and output.

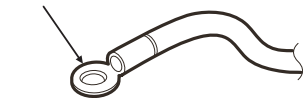


Length of stripped power cable

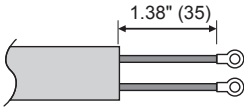


Attach a round pressure terminal to the end of each wire of the power cable, communication cable and power cable for central controller.

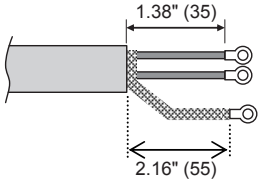
Round pressure terminal



Length of stripped TCC-LINK communication cable

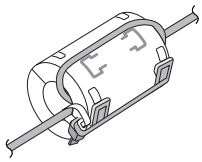


Length of stripped RS-485 communication cable



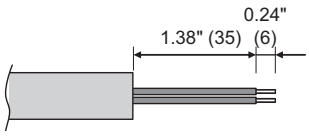
Attach the supplied clamp filter to the LAN cable.
* Wind the LAN cable around the clamp filter as shown below when attaching the filter to the cable. After attaching the filter, fix it to the LAN cable using a supplied tie-wrap.
* Attach the clamp filter as near the main unit as possible.

LAN cable

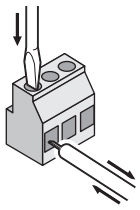


Smart Manager only

Length of stripped digital Input / Output communication wire



Loosen the screw with the screw driver, insert the digital input / output communication wire, then tighten the screw again to fix the wire firmly.



REQUIREMENT

- Disconnect the appliance from the main power supply.
  This appliance must be connected to the main power supply by a circuit breaker or switch with a contact separation of at least 3 mm.
- Fasten the screws to the terminal with torque of 0.5 Nm.

■ Connections to External Equipment

Example of connection to external equipment which is connected to digital input / output connector.

Designation	Input / Output item	Central Controller side		External equipment side	
		Input / output conditions	Terminal name	Example of circuit	Input / output conditions
DO1 (Alarm output) DO2 (Run output) DO-COM (Output common)	Status output	Allowable terminal voltage / current DC24 V / 35 mA			Wiring length: 320 ft (100 m) or less
DI1 (All stop input 1) DI2 (All start input) DI3 (All stop input 2) DI-COM (Input common)	Control input	Non-voltage A contacts Pulse or static * Non voltage contacts must be compatible with minimal current. DC5 V / 3 mA			Pulse width: 300 ms or more Wiring length: 320 ft (100 m) or less

<Specifications for Wiring>

Use the following materials to connect signal lines and power lines (locally procured)

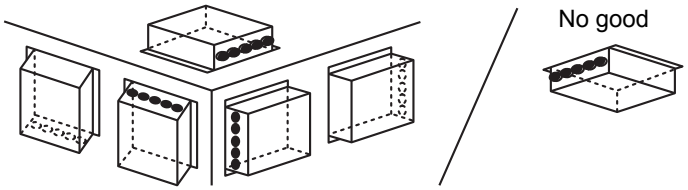
No	Line	Type / Wire size / Length
1	For TCC-LINK	2-core shield wire
		AWG16 (1.25 mm²), 3200 ft (1000 m) max. (total length including air conditioner area) AWG14 (2.00 mm²), 6500 ft (2000 m) max.
2	For RS-485	2-core shield wire
		AWG16 (1.25 mm²), 1600 ft (500 m) max. (total length)
3	For power (120 VAC)	H05RN-F or 245IEC57 AWG18 (0.75 mm²), 160 ft (50 m) max.
4	For digital Input / Output connection	2-core wire AWG22 (0.3 mm²), 320 ft (100 m) max.
5	For power supply (Between the power unit and central controller)	4-core wire AWG18 (0.75 mm²), 60 ft (20 m) max.

7 PRODUCT CONNECTION DIAGRAM

BMS-IFWH5UL • BMS-IFDD03UL (Energy Monitoring Relay Interface, Digital Input / Output Relay Interface)

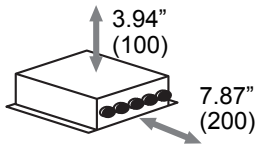
Installation Method and Orientation

There are five installation methods for this relay interface as shown below: surface mount and wall mounts.



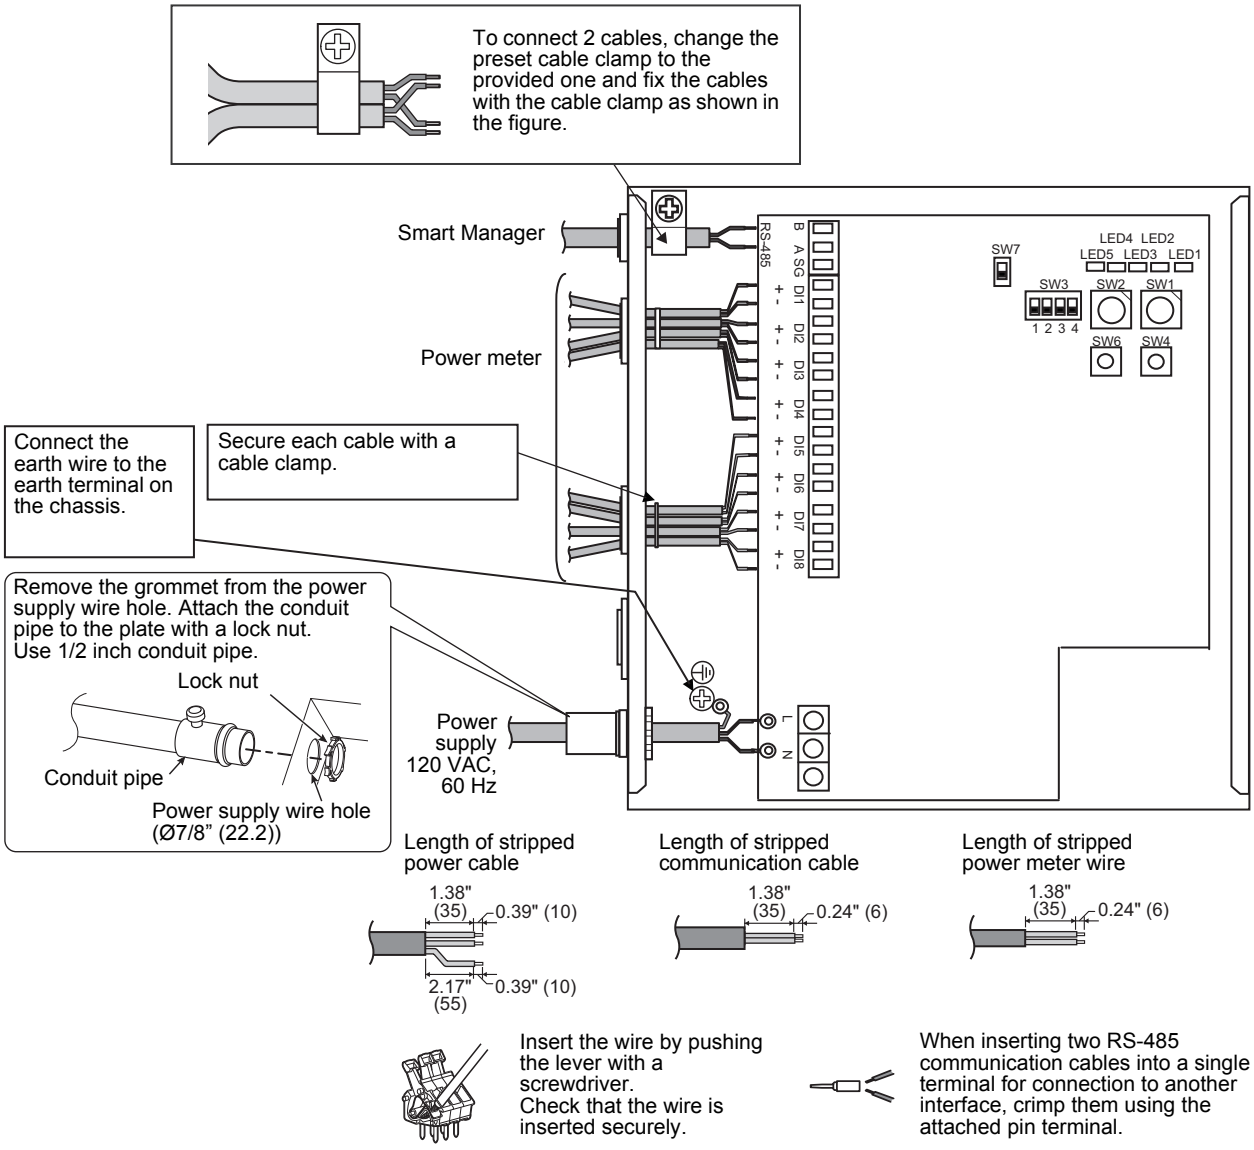
Installation Space and Maintenance Space

A side space for connecting through cable inlets and an upper space for maintenance must be reserved before installation. The other sides can be adjacent to surrounding objects.



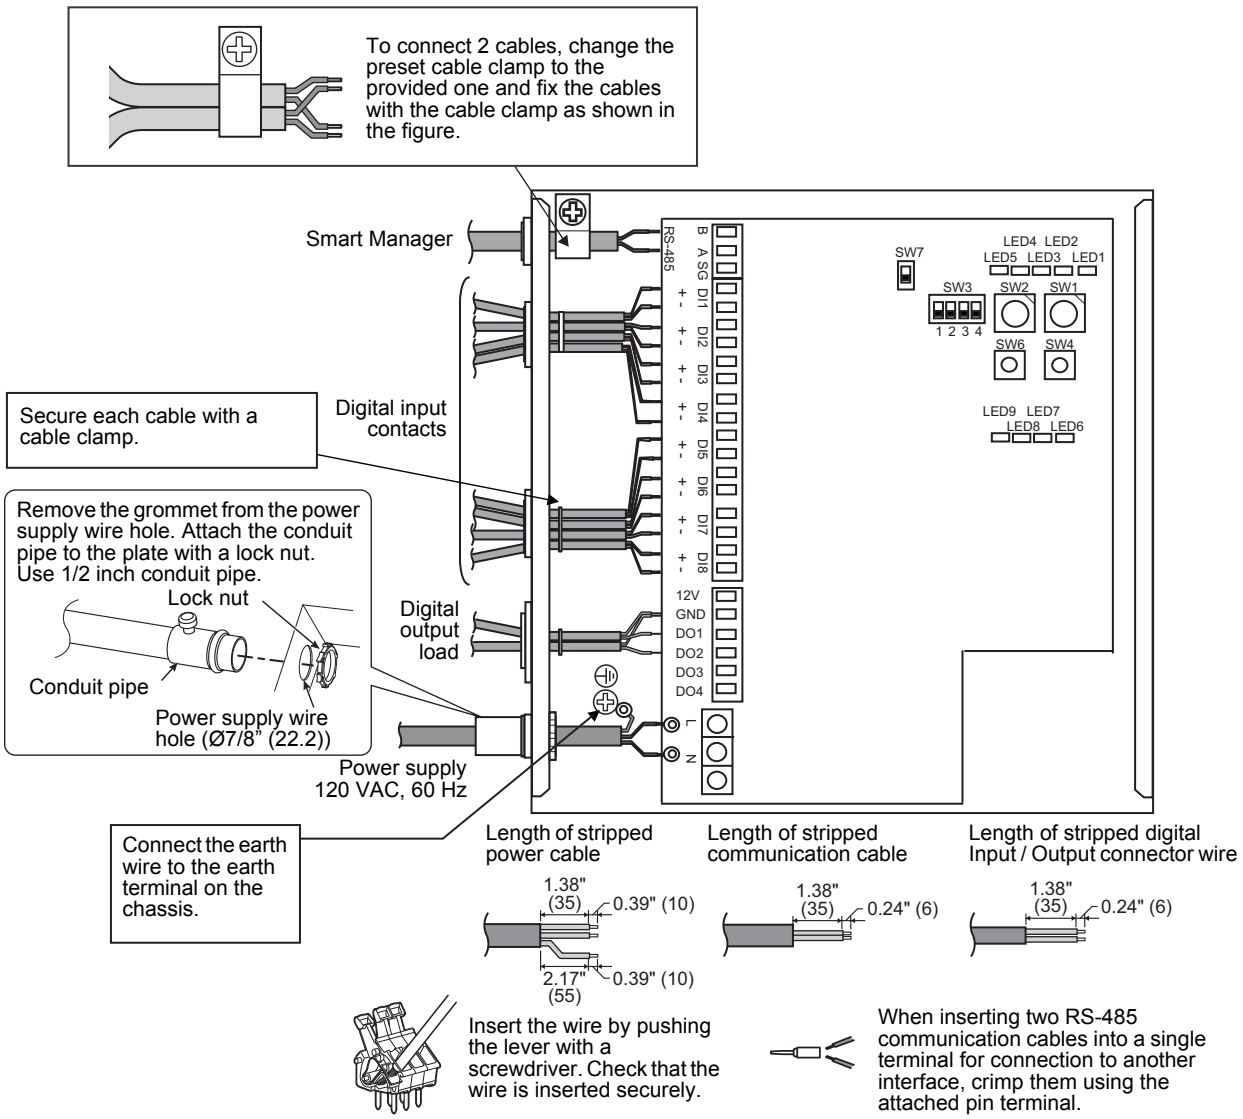
7-1. Energy Monitoring Relay Interface (BMS-IFWH5UL)

Connect power cables, earth wires, and communication cables to the specified terminals on the terminal block.



7-2. Digital Input / Output Relay Interface (BMS-IFDD03UL)

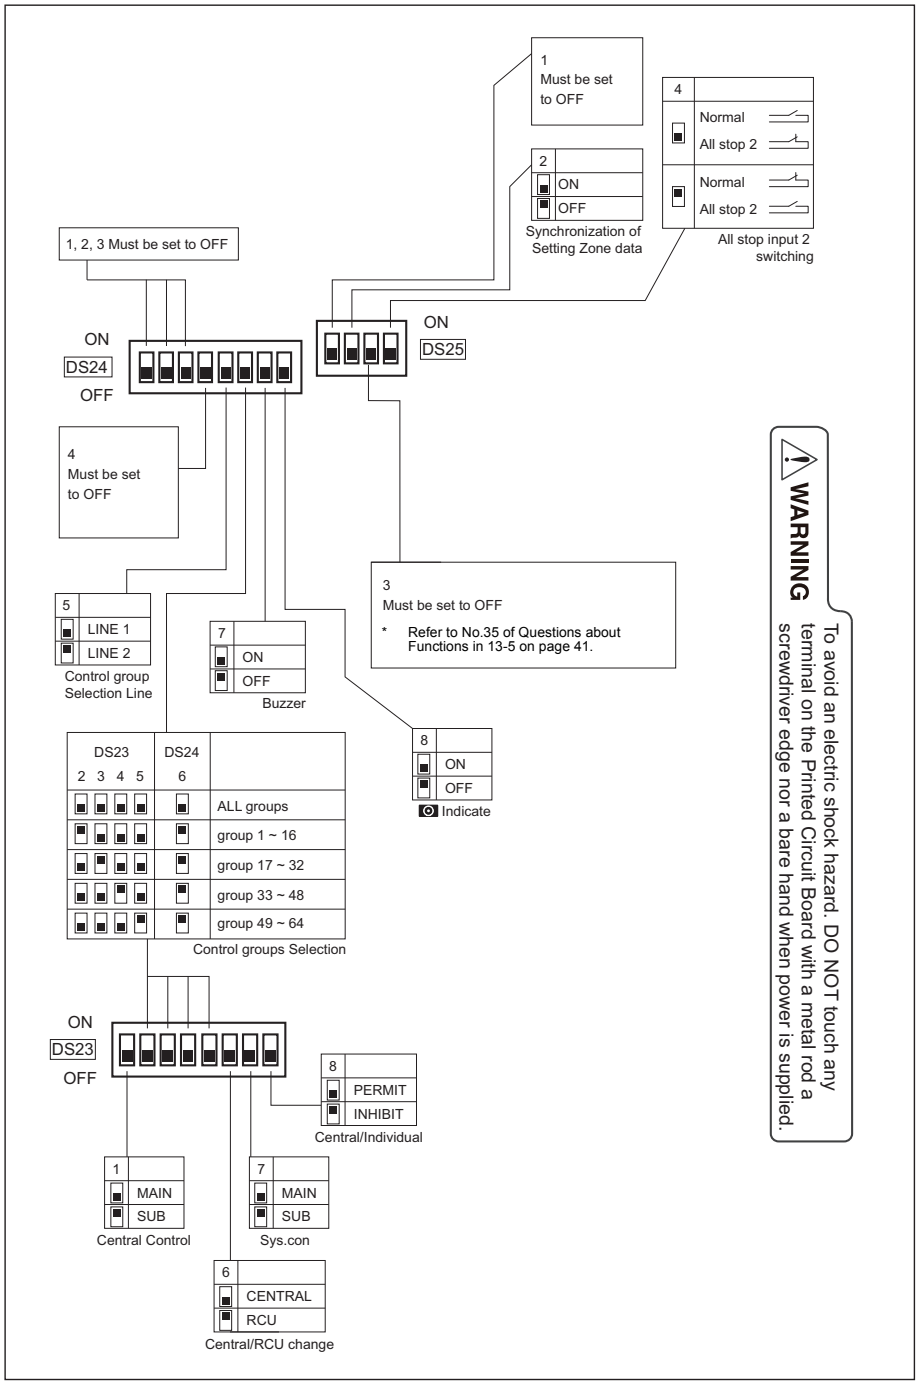
Connect power cables, earth wires, and communication cables to the specified terminals on the terminal block.



8 SWITCHES FOR SETTING

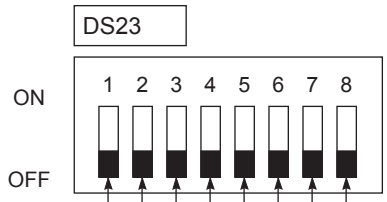
8-1. Smart Manager (BMS-SM1280HTLUL) Central Remote Control (BMS-CM1281TLUL)

The settings switch is installed on the rear of the Smart Manager / Central Remote Control.



<DS23>

Factory setting: All OFF



<1> Smart Manager / Central Remote Control main / sub selection

OFF: Main
ON: Sub

Normally, this bit is set to OFF.

When two Smart Manager / Central Remote Control units are used as a main unit and a sub unit with the same mode setting, set this bit to OFF (Main) for one unit and to ON (Sub) for the other unit.

<2> to <5> Control group selection

Control group selection	DS24-<6>	DS23
All groups	OFF	-
Group 1 ~ 16	ON	<2> ON
Group 17 ~ 32	ON	<3> ON
Group 33 ~ 48	ON	<4> ON
Group 49 ~ 64	ON	<5> ON

These bits specify a group range used in the control group selection. The Smart Manager / Central Remote Control for which control group selection is set controls only groups within the set group range.

To use the control group selection, set DS23-<2> to <5> and DS24-<5> to <6>. For details, see “9.MODE SETTING FOR Smart Manager / Central Remote Control”.

<6> Central control / remote controller mode selection

OFF: Central control mode
ON: Remote controller mode

Central control mode: The smart manager / central remote control is used as the central control device.
Remote controller mode: The smart manager / central remote control is used as the remote controller.

<7> Central control Main / Sub selection

OFF: Main
ON: Sub

This setting is required when multiple Smart Manager / Central Remote Control units are used or another central control unit is used.

(1) Set this bit to OFF when one Smart Manager / Central Remote Control unit is used.
(2) When multiple central control units are used as a main unit and sub units, set to OFF (Main) for one unit and set to ON (Sub) for other units.

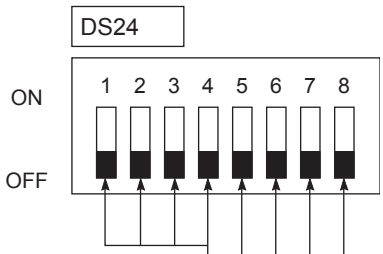
<8> Central button enable / disable

OFF: CENTRAL ○ button operation is permitted
ON: CENTRAL ○ button operation is inhibited

* The CENTRAL ○ button is disabled in the remote controller mode regardless of this setting.

<DS24>

Factory setting: All OFF



<1> to <4> Always OFF

Always set this bit to OFF.

<5> Control group Selection line

OFF: LINE 1
ON: LINE 2

* Set a line number for which the control group selection is used.

<6> Control group selection enable

OFF: Normal mode
ON: Control group selection

Set this bit to ON when the control group selection is used.

* To use the control group selection, set DS23-<2> to <5> and DS24-<5> to <6>. For details, see “9.MODE SETTING FOR Smart Manager / Central Remote Control”.

<7> Buzzer

OFF: With buzzer sound
ON: Without buzzer sound

<8> ⊙ indication

OFF: Displayed
ON: Not displayed

<DS25>

Factory setting: All OFF

<1> Always OFF

- Always set this bit to OFF.

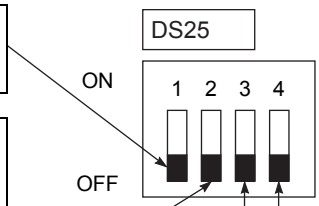
<2> Synchronization of zone setting data

OFF: With synchronization
ON: Without synchronization
This bit specifies whether to perform synchronous communication of zone setting data between Smart Manager / Central Remote Controls.

* When this bit is set to ON (without synchronization), synchronous communication is not performed, and when zone setting is made, the data is not reflected in other Smart Manager / Central Remote Controls.

<3> Always OFF

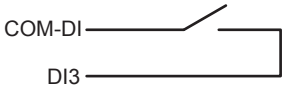
- Always set this bit to OFF.



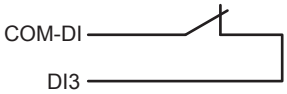
<4> All stop input 2 switching (Set this switch to match the all stop input 2 connection set in chapter 4.)

Set OPEN or CLOSE input junction pegged to all stop 2.

- OFF: Set CLOSE input junction pegged to all stop 2.

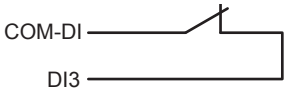


(Normal)

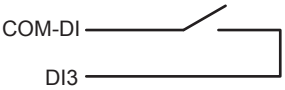


(All stop 2)

- ON: Set OPEN input junction pegged to all stop 2.



(Normal)



(All stop 2)

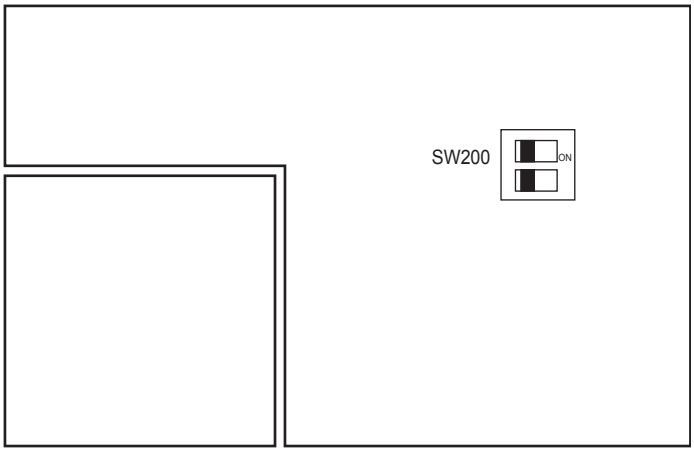
* All stop: All indoor units will be stopped and cannot be operated with remote control.

■ Termination

The termination switches for TCC-LINK are placed in the central controller box. Detach the panel when configuring termination setting.

NOTE

TCC-LINK connection is terminated on indoor units. Set SW 200 to “Open” for both TCC-LINK 1 and 2.

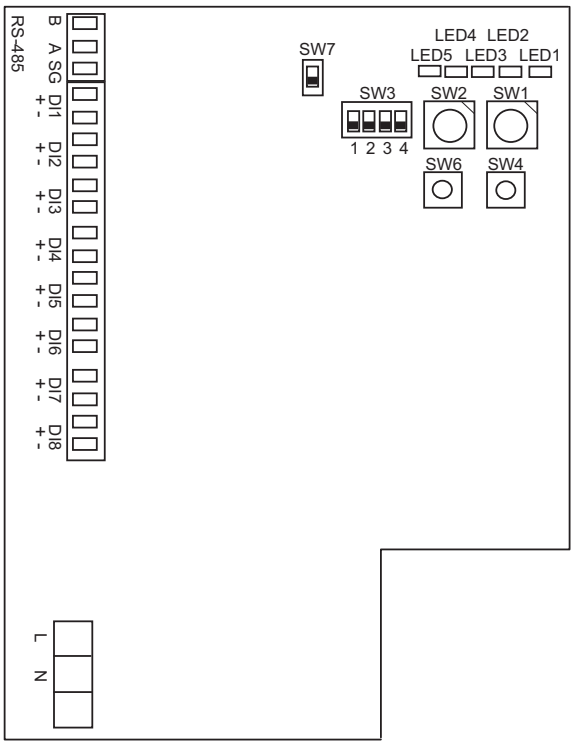


SW200	TCC-LINK termination switches			
				
	TCC-LINK1	Open	TCC-LINK1	100Ω
	TCC-LINK2	Open	TCC-LINK2	Open
				
	TCC-LINK1	Open	TCC-LINK1	100Ω
	TCC-LINK2	100Ω	TCC-LINK2	100Ω

8-2. Energy Monitoring Relay Interface (BMS-IFWH5UL)

The following settings are necessary to use Energy Monitoring Relay Interfaces.

Address setting	SW1 Address set switch When two or more Energy Monitoring Relay Interfaces are used, set a different address for each unit to avoid address duplication.
RS-485 terminator resistor setting	Set SW7 as “120 ohm” on a Energy Monitoring Relay Interface with address SW1=1, and “Open” on the other interfaces.

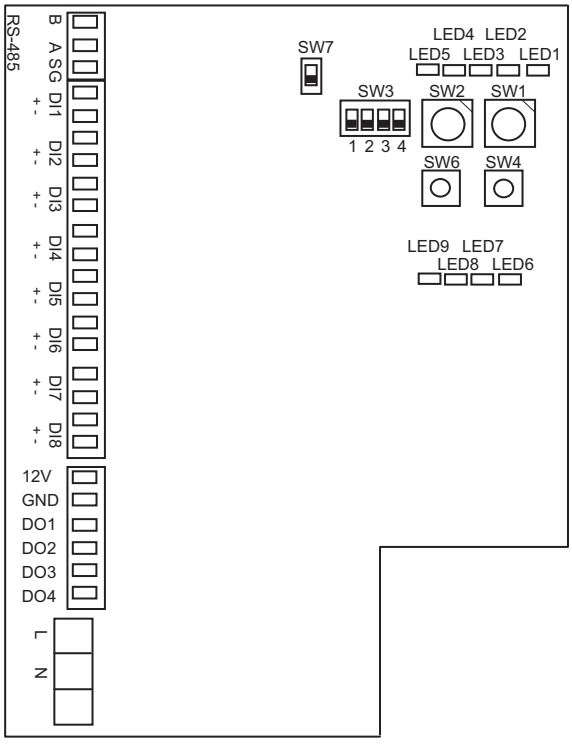


SW1	Address set switch	
	1-8	Address
	0, 9-F	Not used
SW2	Operating mode set switch (0 usually)	
SW3	Test switch (all OFF usually)	
SW4	Test switch	
SW6	Reset switch	
SW7	RS-485 terminator resistor select switch	
		
	120 ohm	Open
LED1	Power indicator	
LED2	RS-485 communication status indicator	
LED3	Not used	
LED4	Test indicator	
LED5	Test indicator	

8-3. Digital Input / Output Relay Interface (BMS-IFDD03UL)

The following settings are necessary to use Digital Input / Output Relay Interfaces.

Address setting	SW1 Address set switch When two or more Digital Input / Output Relay Interfaces are used, set a different address for each unit to avoid address duplication.
RS-485 terminator resistor setting	Set SW7 as “120 ohm” on a Digital Input / Output Relay Interface with address SW1=1, when the Digital Input / Output Relay Interface is used in a system without Energy Monitoring Relay Interface. Set SW7 as “Open” on the other interfaces.



SW1	Address set switch	
	1-8	Address
	0, 9-F	Not used
SW2	Operating mode set switch (0 usually)	
SW3	Test switch (all OFF usually)	
SW4	Test switch	
SW6	Reset switch	
SW7	RS-485 terminator resistor select switch	
		
	120 ohm	Open
LED1	Power indicator	
LED2	RS-485 communication status indicator	
LED3	Not used	
LED4	Test indicator	
LED5	Test indicator	
LED6 -LED9	Digital output indicator	

9 MODE SETTING FOR Smart Manager / Central Remote Control

■ Operation mode

You can switch the functional mode of the smart manager / central remote control between the central control mode and remote control mode. The mode is switched with the dip switch DS23-<6>.

OFF side: Central control mode
This Smart Manager / Central Remote Control is used as a central control unit.
Settings with the remote controller are inhibited by the setting of the Smart Manager / Central Remote Control.

ON side: Remote control mode
This Smart Manager / Central Remote Control is used as a remote controller.
Settings with the Smart Manager / Central Remote Control are inhibited by the setting of another central control unit.

■ Control group selection

An arbitrary range of a line and 16 groups (1 to 16, 17 to 32, 33 to 48, and 49 to 64) can be selectively set.

		DS23				DS24	
		<2>	<3>	<4>	<5>	<5>	<6>
All groups		OFF	OFF	OFF	OFF	OFF	OFF
LINE 1	Group 1 to 16	ON	OFF	OFF	OFF	OFF	ON
	Group 17 to 32	OFF	ON	OFF	OFF	OFF	ON
	Group 33 to 48	OFF	OFF	ON	OFF	OFF	ON
	Group 49 to 64	OFF	OFF	OFF	ON	OFF	ON
LINE 2	Group 1 to 16	ON	OFF	OFF	OFF	ON	ON
	Group 17 to 32	OFF	ON	OFF	OFF	ON	ON
	Group 33 to 48	OFF	OFF	ON	OFF	ON	ON
	Group 49 to 64	OFF	OFF	OFF	ON	ON	ON
Example: When setting LINE 1 (group 1 to 32) in the control group selection		ON	ON	OFF	OFF	OFF	ON

* When the control group selection is not used (“ALL group”), all groups and zones on LINE 1 and LINE 2 can be controlled.

* When the control group selection is used, only groups and zones in the set group range can be controlled.
- When the control group selection is used, groups and zones outside this range are not displayed and cannot be operated.
- ALL means the entire set group range.
- Zones can be registered and operated only within the set group range. (No groups outside the range can be registered or operated.)
- The group control mode is available only for one line.

* Multiple group ranges can be specified by the control group setting.

(Example) When groups 33 to 48 and groups 49 to 64 are specified at the same time, a group range (groups 33 to 64) is set by the control group setting.

10 ZONE SETTING

■ What is zone?

- A zone is a control unit consisting of a combination of any indoor units and the settings of indoor units in a zone can be configured collectively.
- You can make up to 64 zones pairing any of up to 64 groups in a line. By using lines 1 and 2, you can set up to 128 zones in total.
- As factory setting, each zone contains one group to make zone numbers equal to group numbers.

■ Setting zones

Register groups in a zone or cancel them.

(1) Change the mode to the zone setting mode.

- Press the CHECK button, SET button, and ZONE ▲ button simultaneously for at least 4 seconds.
  (The displayed zone number flashes and the Smart Manager / Central Remote Control enters the zone setting mode. Indicates CODE No. “E1”.)

(2) Select the zone to be set.

- Select the zone number to be set with the ZONE ▲ or ▼ button, and then press the SET button to fix the selection.
  (When the selection has been fixed, the selected zone number lights.)
- When selection of zone has been fixed, the [ ] marks of the group numbers registered in the zone light up.

(3) Change registration of groups in a zone.
Register groups in a zone.

1. Select the group number to be set with the GROUP ▲ or ▼ button. Pressing the SET TEMP. ▲ or ▼ button skips the group number by +16 or by -16.
2. Press the SET button.
   The registered group number stops flashing and lights still.
3. Pressing the CL button restores the state before the SET button is pressed.
4. To continue registration of groups, repeat this procedure from the 1.

NOTE

No zone data has been stored at this time. If the ZONE ▲ or ▼ button is pressed before the registration change is fixed, the set content for registration change is discarded.

(4) Fix the registration change.
Press the CHECK button. The set content for registration change is stored in the memory.

* After the memory write operation has been completed, the Smart Manager / Central Remote Control exits the zone setting mode.

NOTE

- Any indoor unit cannot be registered on to two or more zones at the same time.
  If you register a group of a zone on to another zone, the group is eliminated from the old zone.
- Zone registration of a group cannot be cancelled. To exclude a registered group from a zone, register it on another zone.

11 CHANGING RETURN-BACK TIME / TEMPERATURE SETTINGS

■ What is return-back?

When the return-back function is activated, the temperature setting exceeding the return-back temperature will automatically be adjusted to the return-back temperature after a certain period of time to prevent extremely high / low temperature setting.

■ Setting the return-back time and temperature

Follow the procedure below to set the return-back time and temperature.

NOTE

Do not change the data of CODE No. 0A and the following item codes to prevent the remote controller from malfunctioning.

Two sets of return-back settings, Return-back 1 and 2, can be stored. Select Return-back 1 or 2 using ITEM SELECT buttons when activating the return-back function.

CODE No.	Item	Data	
		Factory setting	Setting range
01	Activate / deactivate the return-back function	001 (Enabled)	000 (Disabled), 001 (Enabled)
02	Time setting of Return-back 1, for heating	030 (30 minutes)	1 to 60 minutes (in units of 1 minute)
03	Time setting of Return-back 1, for cooling	030 (30 minutes)	1 to 60 minutes (in units of 1 minute)
04	Temperature setting of Return-back 1, for heating	018 (64 °F)	64 to 84 °F
05	Temperature setting of Return-back 1, for cooling	028 (82 °F)	64 to 84 °F
06	Time setting of Return-back 2, for heating	030 (30 minutes)	1 to 60 minutes (in units of 1 minute)
07	Time setting of Return-back 2, for cooling	030 (30 minutes)	1 to 60 minutes (in units of 1 minute)
08	Temperature setting of Return-back 2, for heating	018 (64 °F)	64 to 84 °F
09	Temperature setting of Return-back 2, for cooling	028 (82 °F)	64 to 84 °F

Changing settings

The following shows an example of changing the time (factory default) in the case of return-back 1 heating from 30 minutes to 45 minutes.

(1) Change the mode to the CODE No. setting change mode.
Press the CHECK, CL, and ZONE ▼ buttons simultaneously 4 seconds or more.
(SETTING and CODE No. flash.)

(2) Change the CODE No.
Press SET TEMP ▲ ▼ buttons to set the CODE No. to “02”.
(CODE No. “02” and time setting “30” flash.)

(3) Change the time setting.
Press GROUP ▲ ▼ buttons to set the time setting to “045”.

(4) Press the SET button to determine the data. SETTING and CODE No. stop flashing and stay lit.
To continuously change other settings, repeat steps (2) to (4) above.

(5) Determine the change.
Press the CHECK button to write the updated data in the memory of the remote controller.
* When the data has completely been written in the memory, the CODE No. setting change mode is exited.

NOTE

Setting adjustment is cancelled without determining the change.

12 TEST RUN

Start the system to perform operation check by following the procedure below.

12-1. Preparation

No.	Item	Details		Procedure
1	Preparation	Discuss with a customer to determine details of the following. • Select devices, and create a system diagram • Determine the addresses of an air conditioner and interfaces, and create an address management table • Set an IP address of Smart Manager / Central Remote Control • Create a setting file with the Setting File Creation Software		Refer to the Owner's manual of the Setting File Creation Software.
2	Device installation	Install Smart Manager / Central Remote Control and the interfaces.		Refer to "INSTALLATION OF THE Smart Manager / Central Remote Control" (page 12) in this manual. For further details, refer to the Installation manual of each device.
3	Wiring	Connect the power cables, ground wires, and signal wires to Smart Manager / Central Remote Control and the interfaces.		Refer to "CONNECTION OF POWER CABLES / EARTH WIRES / COMMUNICATION CABLES" (page 15) in this manual. For further details, refer to the Installation manual of each device.
4	Device setting	Set the air conditioner and the interfaces.		Set the address of the devices according to the address management table. Refer to "SWITCHES FOR SETTING" (page 20) in this manual. For further details, refer to the Installation manual of each device.
		1) Air conditioner	Address setting	
		2) Energy Monitoring Relay Interface	Address setting, RS-485 termination resistance setting	
		3) Digital Input / Output Relay Interface	Address setting, RS-485 termination resistance setting	
5	Setting file upload	1) Upload the setting file.		For further details, refer to the setting file creation software.
		2) After the change, reset Smart Manager / Central Remote Control.		
6	Client PC setting	Configure network and browser setting of the client PCs.		For further details, refer to the Network Configuration Guide of Smart Manager / Central Remote Control.

12-2. Operation Check

Complete the test run of air conditioners before operation check.

<table>
<tr><th>No.</th><th>Item</th><th colspan="2">Details</th><th>Procedure</th></tr>
<tr><td rowspan="5">1</td><td rowspan="5">Start-up check</td><td colspan="2">• Turn on the all air conditioners.
• Turn on the all interfaces.
• Turn on Smart Manager and check that the LCD displays all the air conditioners where the intensive management addresses are set.
• Check that the interfaces LEDs properly illuminate or blink.</td><td rowspan="5">For further details, refer to the Installation manual of each device.</td></tr>
<tr><td rowspan="2">Energy Monitoring Relay I / F</td><td>LED1 (Red) illuminates</td></tr>
<tr><td>LED2 (Green) blinking</td></tr>
<tr><td rowspan="2">Digital Input / Output Relay I / F</td><td>LED1 (Red) illuminates</td></tr>
<tr><td>LED2 (Green) blinking</td></tr>
<tr><td>2</td><td>Check for electric energy meter input</td><td colspan="2">Check for electric energy meter pulse input</td></tr>
<tr><td rowspan="2">3
(*1)</td><td rowspan="2">Logon</td><td colspan="2">From the client PC browser, access Smart Manager to display the logon screen.</td><td>For further details, refer to the Network Configuration Guide of Smart Manager.</td></tr>
<tr><td colspan="2">In the logon screen, enter a user name and a password to log on.
Factory setting: user name (TCC), password (TCC)
(*) Logon in not available immediately after the start-up. Wait for approx. 5 minutes and enter the information to log on.</td><td rowspan="3">For further details, refer to the Owner’s manual of the Smart Manager.</td></tr>
<tr><td>4
(*1)</td><td>Check at the time of air conditioner setting change</td><td colspan="2">Start or stop the air conditioner from the client PC to check that the air conditioner operates accordingly.</td></tr>
<tr><td>5</td><td>Check air conditioner status display</td><td colspan="2">Change the operation status or the setting status of the air conditioner with its remote controller and confirm that its status will be displayed correctly on browser screen on the client PC monitor.
Change the operation status or the setting status of the air conditioner with its remote controller and confirm that its status will be displayed correctly on the remote control.</td></tr>
</table>

(*1) Target model of this description is Smart Manager (SM1280HTLUL).

13 TROUBLESHOOTING

About the check codes

If there is a problem with the air handling unit or if the controller detects anything unusual with the system, a check code is displayed in the warning list on the computer screen or the LCD of the controller.

Check code	Description	Action
C06	Communication error with the air handling unit	Check the communication status of TCC-Link.
S06	Communication error with BMS-IFWH	Check the communication status of RS-485.
S07	Communication error with BMS-IFDD	Check the communication status of RS-485.
S15	File access error	Check the SD card.
S17	File load error	Check the main file.
S21	Mail transmission error	Check the settings of the e-mail.
S22	Internal communication error	Check the internal wiring and the main file.
Code other than the above	Error detected in the air handling unit	Check the air handling unit.

13-1. Trouble with Connection

(Target model of this section is Smart Manager (SM1280HTLUL) which can be connected to a PC through the Web.)

13-1-1. Logon screen is not displayed.

No.	Cause	Solution
1	The controller is not turned on.	Turn on the controller.
2	The HUB is not turned on.	Turn on the HUB.
3	The LAN cable is not connected.	Check that the LAN cable is inserted into the controller and PC and connect them.
4	The same subnet is not set for the IP address of the controller and that of the PC.	Check the controller and PC IP addresses, and set the same subnet for them. For further details, refer to “Network Configuration Guide”.
5	The browser software is set to use the proxy server.	In setting the browser proxy server, add the controller IP address to the address that does not use the proxy server. For further details, refer to “Network Configuration Guide”.
6	The URL entered in the browser software is incorrect.	Check that the URL is http://the controller's IP address/index.html, and correctly enter this URL.
7	The controller has freezed.	Turn off the controller and wait about 30 seconds. Turn it on again, then access from the browser software after 5 minutes.
8	The controller does not work.	1.Check that the controller and HUB are turned on. 2.Check that the LAN cable is connected. 3.Check that the LED of the controller LAN connector illuminates. * If the LED does not illuminate, the controller is defective. It needs to be repaired.
9	The PC is malfunctioning.	1.Restart the PC and check again if it works. 2.Replace the PC and check again if it works.
10	The LAN cable is defective.	Replace the LAN cable and check again if it works.

13-1-2. Unable to log on.

No.	Cause	Solution
1	The controller is being initialized during the startup process. The dialog message, “No response from the server.” or “The system is being prepared.” appears.	Close the browser once. Wait for 5 minutes and log on again.
2	The user name or password are incorrect. The dialog message, “You failed in login.” appears.	Enter correct user name and password.
3	No user name is entered. The dialog message, “Please input user name.” appears.	Enter a correct user name.
4	No password is entered. The dialog message, “Please input password.” appears.	Enter a correct password.
5	The same user name has already logged on. The dialog message, “The same user is logged already.” appears.	1.Use another user name to log on. 2.If the user logged on can be identified, ask the user to log off. 3.If neither of the above two is unavailable, turn off the controller to log off all the users.
6	The controller has freezed. The dialog message “The system is being prepared.” appears. Even if the browser is once closed and after 5 minutes the controller is logged on, the dialog message “The system is being prepared.” still appears.	Turn off the controller and wait about 30 seconds. Turn it on again, then log on after 5 minutes.
7	Invalid data was written to the file in the controller. • The dialog message “The system is being prepared.” appears. Even if the browser is once closed and after 5 minutes the controller is logged on, the dialog message “The system is being prepared.” still appears. • Even if the controller is once turned off and logged on again after 5 minutes.	Initialize the setting file with the setting file creation software. For further details, refer to the owner’s manual of the setting file creation software.

13-2. Trouble with Web Screen

(Target model of this section is Smart Manager (SM1280HTLUL) which can be connected to a PC through the Web.)

13-2-1. Takes long time to display.

No.	Cause	Solution
1	The network is busy.	Connection via an intra-company LAN may slow the Web screen display due to a busy network. Use the system during off-peak hours of network use, or use a dedicated network to connect a PC with the controller.
		If a 10 BASE switching HUB is used, replace it with a 100 BASE switching HUB.
2	PC performance has degraded.	If some application programs are operating other than the browser, the PC performance may degrade. Close the operating applications other than the browser, and check if the PC performance improves.
3	Trouble due to the browser.	The supported browsers are Internet Explorer 6.0, 7.0 and 8.0 and Firefox 2.0, 3.0, 3.5 and 3.6. If a browser other than these browsers is used, the contents may not be displayed properly. Use one of the supported browsers to see the contents.
4	Other users are also accessing the controller.	If other users are performing schedule setting or other operation, the display switching may slow down. Wait for a while, and access to the controller again.
5	The controller is writing a file.	The controller regularly writes a file for electricity distribution. The display may slow down during the writing process.

13-2-2. Improperly returns to the logon screen.

No.	Cause	Solution
1	The controller performance has degraded.	If the controller is accessed from a browser while the controller internal processing is in progress, the controller performance degrades. To prioritize controller internal processing (writing a file or giving instruction to an air conditioner), the system once stops the access from the browser. Log on again.

13-2-3. After logon, the dialog message “No response from the server.” appears.

13-2-4. After logon, the dialog message “The system is stopping.” appears.

13-2-5. After logon, the dialog message “The system is being prepared.” appears.

No.	Cause	Solution
1	The controller is not turned on.	Turn on the controller. Wait for 5 minutes and logon again.
2	The HUB is not turned on.	Turn on the HUB and log on again.
3	The LAN cable is not connected.	Check that the LAN cable is inserted into the controller and PC and connect them. After that, Log on again.
4	The controller has freezed.	Turn off the controller and wait about 30 seconds. Turn it on again, then access from the browser software after 5 minutes.
5	The controller does not work.	Check that the controller and HUB are turned on.
		Check that the LAN cable is connected.
		Check that the LED of the controller LAN connector is lit. * If the LED of the LAN connector does not illuminate, the controller is defective. It needs to be repaired.
6	The PC is malfunctioning.	Restart the PC and check again if it works.
		Replace the PC and check again if it works.
7	The LAN cable is defective.	Replace the LAN cable and check again if it works.

13-2-6. After logon, the dialog message “Login has been disabled.” appears.

No.	Cause	Solution
1	The user account has been deleted.	The message appears if the user account used for the logon is deleted. Log on with another user account.

13-2-7. The buttons or other elements are not displayed.

No.	Cause	Solution
1	Trouble due to browsers.	The supported browsers are Internet Explorer 6.0, 7.0 and 8.0 and Firefox 2.0, 3.0, 3.5 and 3.6. If a browser other than these browsers is used, the contents may not be displayed properly. Use one of the supported browsers to see the contents.
2	The controller performance has degraded.	If the controller is accessed from a browser while the controller internal processing is in progress, the controller performance degrades. To prioritize controller internal processing (writing a file or giving instruction to an air conditioner), the system once stops the access from the browser. At this time, the browser may fail to display buttons or other elements.
		The missing GUI elements can be displayed by refreshing the browser window. For Internet Explorer, click [View] and then [Refresh]. For Firefox, click [View] and then [Reload].
3	The network is busy.	Connection via an intra-company LAN may slow screen display due to a busy network, possibly causing the display failure of those elements. Use the system during off-peak hours of network use, or use a dedicated network to connect a PC with the controller.
		If a 10 BASE switching HUB is used, replace it with a 100 BASE switching HUB.
		The missing GUI elements can be displayed by refreshing the browser window. For Internet Explorer, click [View] and then [Refresh]. For Firefox, click [View] and then [Reload].
4	The PC performance has degraded.	If some application programs are operating other than the browser, the PC performance may degrade. Close the applications in operation other than the browser, and check if the PC performance improves.

13-2-8. The screen does not switch or takes long time to switch.

No.	Cause	Solution
1	Operating schedule is displayed and set.	If many operating schedules are displayed and set, switching the screen takes long time after the operating schedules are set. After selecting a zone of the air conditioner, perform “Change Operating Schedule” to reduce the number of operating schedules performed at a time, and then display and set the schedules.
2	The alarm history list is displayed.	If many alarms are to be displayed, the display takes long time. Wait for the list to be displayed without performing any operation.

13-2-9. The name of floor, tenant, area, or air conditioner is not properly displayed.

No.	Cause	Solution
1	The inputs in the setting file are incorrect.	Correct the name in the setting file, and upload the file to the controller.

13-2-10. The operation state does not match that displayed on the remote controller.

No.	Cause	Solution
1	The inputs in the setting file are incorrect.	Check if the address set in the setting file matches that in the air conditioner. To show the address set in the air conditioner, press the [UNIT] button on the remote controller. Correct the address set in the air conditioner or the setting file.
2	The wiring for TCC-LINK is not properly installed.	The controller has two TCC-LINK connecting terminals: TCC-LINK1 and TCC-LINK2. Check if the setting in the setting file matches the actual connection. If not, correct so that they match.

13-2-11. Unable to log off.

No.	Cause	Solution
1	The communication with the controller is unavailable.	The dialog message “No response from the server” appears, and closing the dialog displays the message “Internet Explorer cannot display the webpage.” or “The connection has timed out.”. Take the same action as for the case, “13-2-3. After logon, the dialog message “No response from the server.” appears.”.

13-2-12. The browser does not close.

No.	Cause	Solution
1	The communication with the controller is unavailable.	The browser takes some time to close. Wait for a while for the browser to close.
2	The PC is malfunctioning.	1.The browser takes some time to close. Wait for a while for the browser to close. 2.If it does not close after a while, start the task manager to exit the browser.

13-2-13. The floor, tenant, area, or air conditioner is not displayed in the proper order.

No.	Cause	Solution
1	The inputs in the setting file are incorrect.	The floor, tenant, and area are displayed in the order of the floor number, tenant number, and area number set in the setting file. Change the display order as needed.
		The air conditioners are displayed in the order of outdoor system number and indoor units number set in the air conditioner. Change the display order as needed. If the order cannot be changed, change the air conditioner number in the setting file.

13-2-14. The date or time is not properly displayed.

No.	Cause	Solution
1	The controller has been off for long hours.	In [Clock and calendar setting] from the option in the menu, set the current time.

13-2-15. The value of air temperature is incorrect.

No.	Cause	Solution
1	The air temperature displays the intake temperature corrected for the room temperature control of the air conditioner.	The displayed and actual temperatures differ because correction amount varies depending on an operation mode (cooling or heating).

13-3. Other Troubles

(Target model of this section is Smart Manager (SM1280HTLUL) which can be connected to a PC through the Web.)

13-3-1. The date or time change is not applied.

No.	Cause	Solution
1	The internal processing of the controller is prioritized.	The internal processing of the controller may be given priority over a setting operation from the browser. Try to change the date or time again.

13-3-2. The air conditioners do not operate as scheduled.

No.	Cause	Solution
1	The controller is not turned on.	Turn on the controller.
2	The scheduled operation is not correctly set.	Check that the operating schedule of each air conditioner is correctly set.
		Check that the air conditioner for which the operating schedule is set matches the air conditioner to be operated.
		Check that the date and time setting is correct. * Correct the settings above if necessary, and set operating schedule so that the air conditioner operates after 3 minutes and see if it operates as scheduled.
3	The controller has freezed.	Turn off the controller, then turn it on again after 30 seconds.

13-3-3. The operation is unavailable with the remote controller.

No.	Cause	Solution
1	The remote controller control is set to not allowed.	Check with the controller LCD that the control is set to “CENTRAL”. To enable the operation with the remote controller, change the setting in the controller to “No indication”.

13-3-4. The air conditioner does not operate according to the operation setting, such as operate or stop, made from the browser. The settings go back to the previous state after a while.

No.	Cause	Solution
1	The system does not properly communicate with the air conditioner.	Check if the communication error with the air conditioner is detected.
2	The indoor unit is set as the extension unit.	Change the setting in the setting file so that air conditioner is set as the main unit.
3	The operation setting falls outside the range of the temperature or operation mode set in the air conditioner.	If the setting falls outside the set temperature range, the temperature will be set to the upper or lower limit value of the set temperature range.
		If the setting falls outside the range of the set operation mode, the air conditioner does not operate in the mode set. It operates in the mode before the change.

13-3-5. The details of schedule set is not displayed.

No.	Cause	Solution
1	The schedule setting operation failed.	The setting made without selecting a schedule point in the schedule setting window does not apply to the schedule point. Select a schedule point and perform setting.
		In the schedule setting window, if the setting is finished with [OK] without clicking [Set], the scheduled data set is not finalized. Click [Set] and then [OK] to finish.

13-3-6. Clicking [OK] or [Cancel] does not close the window or takes some time for the window to close.

No.	Cause	Solution
1	Operating schedule is displayed and set.	If many operating schedules are displayed and set, closing the operating schedule window takes some time after [OK] or [Cancel] is clicked. Wait for the window to close without performing any operation.
2	The controller performance has degraded.	If the controller is accessed from a browser while the controller internal processing is in progress, the controller performance degrades. Because the controller internal processing (writing a file or giving an instruction to the air conditioner) is prioritized, closing the window takes some time. Wait for the window to close without performing any operation.

13-3-7. The User added in User Account is not applied.

No.	Cause	Solution
1	The controller is turned off within 20 minutes after the user account is added.	Setting information such as user account is written to the file in the controller at 20-minute intervals. Leave the controller on for 20 minutes or longer after setting a user account.

13-3-8. The set temperature is automatically changed.

No.	Cause	Solution
1	The set temperature or Return Back is set in the scheduled operation setting.	Check if the setting details of the operating schedule is correct.
2	The set temperature is changed from the remote controller or other controllers.	Check if the remote controller or other controller is wrongly used for operation.

13-3-9. The cooling or heating operation does not work with “The operation is being prepared” displayed on the remote controller.

No.	Cause	Solution
1	The operating mode restriction is set.	In [Operation mode restriction] from the option in the menu, check if [HEAT,FAN] or [COOL,DRY,FAN] is selected.

13-3-10. The calculation result of electricity amount output by the Monthly Report Creation Software is not correct.

No.	Cause	Solution
1	The controller cannot receive the air conditioner operating information due to a communication error.	Check if the communication error with the air conditioner is detected.
2	The controller cannot acquire the correct electricity amount.	Check if the communication error with the air conditioner is detected.
		Check if pulse is input to the electricity amount meter interface from the electricity amount meter.
3	The room takes more time to warm up or cool down than other rooms.	This electricity distribution system calculates electricity amount to be distributed based on the necessary capacity of the indoor units for controlling temperature. This can distribute larger electricity amount to the room that is not easily warmed up or cooled down than to other rooms in the same operation time period.

13-3-11. No daily report file is found.

No.	Cause	Solution
1	The controller was not turned on at the time of meter-reading.	If the controller is off at the time of meter-reading, the daily report file of the day is not created. The accumulated operation hours and electricity amount are added up to the daily report file of the next day, so the values in the daily reports will be correctly summed up.

13-3-12. An alarm other than C06, S06, or S07 is displayed on the air-conditioning management system window.

No.	Cause	Solution
1	The air conditioner has detected the alarm	Check the inspection indication on the remote controller or the multi outdoor unit board.
		Identify defective parts or check the parts and wiring by following the service guide of each air conditioner.

13-4. Trouble at Installation

13-4-1. The IP address cannot be changed.

(Target model of this section is Smart Manager (SM1280HTLUL) which can be connected to a PC through the Web.)

No.	Cause	Solution
1	The address setting method was not changed to manual setting before changing the IP address.	To change the IP address, the address setting method must be set to manual setting “1”. Change the method to manual setting.
		When the method is changed to manual setting, the IP address that was manually set at the last time is shown. If the IP address has never been changed, it is shown as all “0”, so the proper IP address needs to be set.
2	The IP address is being set.	After the address is changed, the controller restarts for the address setting. Wait for 5 minutes after changing the address, and check that the address has been changed.

13-4-2. IP address is unknown.

(Target model of this section is Smart Manager (SM1280HTLUL) which can be connected to a PC through the Web.)

No.	Cause	Solution
1	The address setting method is set to automatic acquisition, and the DHCP server is not connected.	After connecting to the DHCP server, check with the controller IP address display for the address.
		Change the address setting method to manual setting, and set the IP address.
2	The IP address has been changed.	Check with the controller IP address display for the address is detected.
		Set the address setting method to manual setting, and set the IP address.

13-4-3. The controller LCD displays incorrect details.

No.	Cause	Solution
1	None of the air conditioner is connected or turned on.	When communication is unavailable with any air conditioner, any of the following is displayed: “LINE” and “ALL”, “ZONE”, or “GROUP”. Check if the air conditioner is turned on or communication wiring is properly installed.

13-4-4. Lock input does not stop the air conditioner.

No.	Cause	Solution
1	Communication error with the digital input / output relay interface.	1.Check if communication error with the digital input / output relay interface is detected.
		2.Check if communication error with the air conditioner is detected.
2	Communication error with the air conditioner.	1.Check if communication error with the digital input / output relay interface is detected.
		2.Check if communication error with the air conditioner is detected.
3 (*1)	The inputs in the setting file are incorrect.	Check if the lock input name is correctly set in the [Indoor unit group definition] sheet of the setting file.

(*1) Target model of this description is Smart Manager (SM1280HTLUL) which can be connected to a PC through the Web.

13-4-5. Communication error with the digital input / output relay interface is displayed.

No.	Cause	Solution
1	The digital input / output relay interface is not turned on.	Check if the “POWER” LED of the digital input / output relay interface illuminates.
2	The RS-485 communication wiring is not connected or disconnected.	Check the conduction of the communication wiring.
3	The RS-485 communication wiring is incorrect or connected with wrong polarity.	Check the terminal block connected.
4	The terminal resistance is not connected.	Check the value of the terminal resistance with a tester.
5	The wiring length is too long.	Change it to the specified wiring length.
6	The communication circuit of the digital input / output relay interface failed.	Replace with the normal digital input / output relay interface and check that the communication is available.
7	The communication circuit of the controller failed.	Replace with the normal controller and check that the communication is available.
8	Noise is superposed on the communication wiring.	Check the waveform between RS-485 communication wiring A and B. If noise is superposed, identify the noise source and remove it.
9	The communication cable in use is not the specified one. (Wire diameter is smaller)	Change it to the specified communication cable.

The address switch setting of the digital input / output relay interface does not match that in the setting file.
(Target model of this section is Smart Manager (SM1280HTLUL) which can be connected to a PC through the Web.)

No.	Cause	Solution
3	The RS-485 wiring is defective between the digital input / output relay interface and the controller.	1.Check the address switch setting of the digital input / output relay interface and the setting in the setting file.
		2.Check if the RS-485 LED (Green) of the digital input / output relay interface blinks.

13-4-6. Communication error with the energy monitoring relay interface is displayed.

No.	Cause	Solution
1	The energy monitoring relay interface is not turned on.	Check if the “POWER” LED of the energy monitoring relay interface illuminates.
2	The address switch setting of the energy monitoring relay interface does not match that in the setting file.	1.Check the address switch setting of the energy monitoring relay interface and the setting in the setting file.
		2.Check if the RS-485 LED (Green) of the energy monitoring relay interface blinks.

13-5. Questions about Functions

No.	Questions	Answer
1 (*1)	What is the procedure to create a setting file?	Please read the Owner's manual of the Setting File Creation Software.
2	How many air conditioners can be connected?	Up to 128 units of air conditioners can be connected. Note that up to 64 units can be connected per TCC-LINK line.
3	How many air conditioners can be connected?	Up to 64 units can be connected per TCC-LINK line. The controller has two TCC-LINK lines, thus up to 128 units can be connected.
4	How many central remote controllers can be connected?	Up to 10 central remote control devices can be connected per TCC-LINK line. The central control devices include a central remote controller.
5	Can the BACnet system be used together?	Not possible. However, it is possible to use BACnet system together with a central control device other than the Web-based central remote controller.
6	Can the LONwork system be used together?	Possible. Check that it works.
7	Can a remote monitoring system be used together?	Not possible. However, it is possible to use a remote monitoring system together with a central control device other than the Web-based central remote controller.
8	Can a device in the AI-NETwork series be connected?	Not possible. Use an air conditioning management system supported for the AI-NETwork series.
9 (*1)	Up to how many PCs can be connected?	Up to 4 users can simultaneously log on. Up to 4 PCs can be simultaneously connected. Without simultaneous connection, the number of PCs connected has no limitation.
10 (*1)	How many users can simultaneously access the system?	
11 (*1)	Can the system connect to an intra-company LAN?	Possible. However, check with your network administrator if the connection is available.
12	Is connection available via the Internet (WAN)?	Not available.
13	Is connection available from a mobile phone?	
14	If a failure occurs on the air conditioner, can mail be sent?	Not possible.
15 (*1)	Can a tenant name or other names be changed?	You can use the Setting File Creation Software to change the name of a floor, a tenant, an area, and an air conditioner.
16 (*1)	Up to how many characters can be used for the name of tenant, etc.?	For a floor name: 20 bytes, for a tenant name: 30 bytes, for an area name: 20 bytes, and for an air conditioner name: 20 bytes.
17 (*1)	How many items does the alarm history save?	It saves up to 1,024 items. If the alarm history items exceed 1,024, the item is deleted sequentially from the oldest one.
18 (*1)	How many days of power distribution data does the system save?	The system saves the 45 days of daily report files and the 3 months of monthly report files.
19	Can data be maintained in case of power outage?	Data will be backed up before being saved. If power outage occurs during the data saving, the backup data is restored, thus the data is protected.
20	Does turning off the controller require any specific operation?	No specific operation is necessary.
21	Does turning off the controller stop the air conditioner?	The air conditioner where the remote controller or wireless adaptor is connected does not stop when the controller is turned off. An air conditioner other than the above stops.
22 (*1)	Does a scheduled operation work only if a PC remains connected?	No. Because the power distribution data are saved inside the controller, the PC does not need to remain connected.
23 (*1)	Does a PC need to remain connected to save power distribution data?	An alarm can be set to go off with a buzzer or other means connected to the alarm external output of no-voltage A contact.
24 (*1)	Is it possible to know an air conditioner failure without connecting a PC?	An alarm can be set to go off with a buzzer or other means connected to the alarm external output of no-voltage A contact.
25 (*1)	How many master schedules can be created?	Up to 32 schedules can be created for each master schedule and billing schedule.
26 (*1)	How many billing schedules can be created?	
27 (*1)	What are the PC requirements for connecting to the controller?	1.PC running Window XP or Vista without any problem. Also, the PC must have Internet Explorer Version 6.0, 7.0 or 8.0 or Firefox 2.0, 3.0, 3.5 or 3.6. 2.If you use the Monthly Report Creation Software, you need to install Microsoft Excel 2002 or later on your computer.

No.	Questions	Answer
28 (*1)	Can a schedule be separately set for each air conditioner?	One air conditioner can register only one master schedule while 32 master schedules can be created. An operating schedule can be separately set for each air conditioner.
29 (*1)	What is the billing schedule?	A day is divided into two time frames: on-hours and off-hours, and power is distributed to each time frame. For example, the billing schedule can be used to charge only for the operation during overtime work hours.
30	Can all the indoor units be made stop at a time?	Possible. In the zone window of a PC, select all floors or all tenants and perform setting for the stop. (Target model of this description is Smart Manager (SM1280HTLUL).) For all the indoor units, set lock interlocking that is activated by the same lock input. Apply the external input of all stop to the controller.
31	Is monitoring the operation state of the outdoor unit possible?	Not possible.
32	Does setting operation for an air conditioner have any priority?	The button pressed later receives priority.
33	Is it possible to connect an indoor unit without its remote controller?	Possible.
34 (*1)	Is connection available via VPN?	Available.
35	What happens if I have inhibited the remote controller via a Web browser and then a power failure stops the indoor unit?	If a power failure stops the indoor unit, the remote controller inhibition setting is canceled. However, if the remote controller is version 5.27 or later, you can set it to maintain inhibition of the remote controller, even if there is a power failure that stops the indoor unit, by turning on 3 of DS25. Even if you do this setting, the inhibition of the remote controller may be canceled for a period of time after the power is turned back on. The version of the remote controller appears on the LCD for a few seconds after Smart Manager is turned on.

(*1) Target model of this description is Smart Manager (SM1280HTLUL) which can be connected to a PC through the Web.

14 TEST RUN CHECK

14-1. Check Items Before Trial Run

<table>
<tr><th>No.</th><th>Check item</th></tr>
<tr><td>1</td><td>Has the electrical work (power supply and communication wiring work) been completed?
<table><tr><th>Key point</th></tr><tr><td>1.When the Energy Monitoring Relay Interface or Digital Input / Output Relay Interface is connected, check that the polarity (A / B) of the wiring is correct.
2.Check that the terminal resistance has been set.
3.When a custom device is connected, check that the TCC-LINK adaptor has been connected.</td></tr></table></td></tr>
<tr><td>2</td><td>Has the addresses of the air conditioner (Indoor units (DN=03, 12, 13, 14)) and outdoor unit (outdoor unit control board switch 13 / 14) been set?</td></tr>
<tr><td>3
(*1)</td><td>Has the setting file been created?</td></tr>
<tr><td>4</td><td>Have the controller switch and DN been set?</td></tr>
<tr><td>5
(*1)</td><td>Has the controller IP address been checked?</td></tr>
<tr><td>6
(*1)</td><td>Have the network and the browser proxy of the PC to be connected been set?</td></tr>
<tr><td>7</td><td>Are all the devices turned on?</td></tr>
<tr><td colspan="2">When the power distribution function is used:</td></tr>
<tr><td>8
(*1)</td><td>Is the Monthly Report Creation Software installed?</td></tr>
<tr><td>9
(*1)</td><td>Is the network setting completed for the PC where the Monthly Report Creation Software is installed?</td></tr>
</table>

(*1) Target model of this description is Smart Manager (SM1280HTLUL) which can be connected to a PC through the Web.

14-2. Procedure of Test Run Check

<table>
<tr><th>No.</th><th>Check item</th><th>No.</th><th>Procedure</th></tr>
<tr><td rowspan="3">1
(*1)</td><td rowspan="3">PC connection check</td><td>1</td><td>Start the browser software of the PC to be connected.</td></tr>
<tr><td>2</td><td>Enter http://the controller's IP address/index.html in the address bar of the browser, and check that the logon window is displayed.
<table>
<tr><th colspan="2">Error message</th></tr>
<tr><td>× NG1:
Network Error</td><td>1) Check if the browser proxy is correctly set.</td></tr>
<tr><td>× NG2:
The server is not found.</td><td>1) Check if the network wiring is correctly installed. (Refer to “15-1. Network Wiring”)
2) Check if the PC’s IP address is correct. (Refer to “15-2. PC’s IP Address”)
3) Check if the controller's IP address is correct. (Refer to “15-3. Controller’s IP Address”)</td></tr>
<tr><td>○ OK:
The logon window is displayed.</td><td>1) Proceed to the logon check.</td></tr>
</table></td></tr>
<tr><td>3</td><td>After entering TCC in User Name and TCC in Password, click “Logon” and make sure that you can successfully logon.
<table>
<tr><th colspan="2">Error message</th></tr>
<tr><td>× NG1:
The dialog message, “Logon failed.” appears.</td><td>1) The user name or password entered are incorrect. Logon again with all the characters in upper case.</td></tr>
<tr><td>× NG2:
The dialog message “No response from the server.” or “The system is being prepared.” appears.</td><td>1) The controller is being initialized during the startup process. Wait for 5 minutes and logon again.</td></tr>
<tr><td>× NG3:
The dialog message “The system is stopped.” appears.</td><td>1) Close the browser and turn off the controller. Wait for 30 seconds and turn on the controller. Wait for 5 minutes and logon again.
2) If the dialog message “The system is stopping.” appears again, initialize the setting file with the Setting File Creation Software and turn off the controller.Wait for 30 seconds and turn on the controller. Wait for 5 minutes and logon again.
3) When successfully logging on after the initialization, upload again the setting file created, and check that you can logon.</td></tr>
<tr><td>○ OK:
The list window displays the indoor units set in the setting file.</td><td>1) Proceed to the next check.</td></tr>
</table></td></tr>
</table>

(*1) Target model of this description is Smart Manager (SM1280HTLUL) which can be connected to a PC through the Web.

<table>
<tr><th>No.</th><th>Check item</th><th>No.</th><th>Procedure</th></tr>

</td></tr>
</table>

No.	Check item	No.	Procedure
6 (*1)	Power distribution check	1	Operate the air conditioner for several hours with the controller in operation.
		2	Perform manual meter-reading from the PC. “Option” > “Manual Meter-Reading” > “Go” (Do not select “don’t continue data reading”.)
		3	Wait for approx. 1 minute until a manual meter-reading file is created.
		4	Selecting “Option” > “Manual Meter-Reading” displays the file created in “Data reading completed”.
		5	Download a monthly report file with the Monthly Report Creation Software.
		6	Select the file displayed in (4) in [File setting].
		7	Check the output result of the monthly report created.
7 (*1)	Scheduled operation check	—	
8 (*1)	PC connection check on site	—	

(*1) Target model of this description is Smart Manager (SM1280HTLUL) which can be connected to a PC through the Web.

15 CHECK POINTS

15-1. Network Wiring

(Target model of this section is Smart Manager (SM1280HTLUL) which can be connected to a PC through the Web.)

<table>
<tr><th>No.</th><th>Check point</th></tr>
<tr><td>1</td><td>Check that the LAN cable is connected to the connector on the upper side of the controller, and the connector's LED illuminates.</td></tr>
<tr><td>2</td><td>Check that the LAN cable is connected to the PC that is connected to the controller via the network, and check that the PC operates normally. (To check the connection, click "Control Panel" -> "Network Connections".)</td></tr>
<tr><td>3</td><td>If a hub or router is installed between the controller and PC, check the power source, wiring, and setting of the hub or router.</td></tr>
<tr><td>4</td><td>Issue the ping command from the PC to check if the network communication is normal.
<table>
<tr><th colspan="2">Error message</th></tr>
<tr><td colspan="2">In the command prompt window, enter "ping 192.168.2.30".
If the controller's IP address has been changed from 192.168.2.30, enter the changed address.</td></tr>
<tr><td colspan="2">○ OK:
"Reply from 192.168.2.30" or "Reply from the controller's IP address" is displayed.</td></tr>
<tr><td>× NG1:
"Destination host unreachable." is displayed.</td><td>Check if the PC's IP address is correct.</td></tr>
<tr><td>× NG2:
"Request time out" is displayed.</td><td>Check if the controller's IP address is correct.</td></tr>
</table>
</td></tr>
</table>

15-2. PC's IP Address

(Target model of this section is Smart Manager (SM1280HTLUL) which can be connected to a PC through the Web.)

No.	Check point
1	In the command prompt window, enter "ipconfig" to show the PC's IP address. "IP Address .....192.168.2.90" or the like is displayed.
2	If no router is used, check that the subnet of the PC is the same as that of the controller.
3	If a router is used, check that the address of Default Gateway is set.

15-3. Controller's IP Address

(Target model of this section is Smart Manager (SM1280HTLUL) which can be connected to a PC through the Web.)

No.	Check point
1	Press the [CHECK], [CL], and [ZONE ▼] buttons simultaneously for 4 seconds or longer to enable the item code setting change mode.
2	Use the [SET TEMP. ▲ ▼ button to switch the item code to 10 through 1B, and check the IP address.
3	For further details, refer to "4-1. Displaying IP address" in the Network Configuration Guide of the Smart Manager.

15-4. TCC-LINK Wiring

No.	Check point
1	Check that the wiring is connected to the TCC-LINK terminal block of the controller.
2	Turn the controller's terminal resistance switch DS1 to OFF, and check that the resistance between U1 / U3 and U2 / U4 of the TCC-LINK terminal block is the terminal value (approx. 100 ohm). This check can determine that the wiring is normal in the system where the terminal resistance is set.
3	For all the centre machine of the multi outdoor units, check that the relay connector between the "U1U2" and "U3U4" terminals is connected.
4	If a custom air conditioner is connected, check that the TCC-LINK adaptor is connected to the main unit of the indoor unit.

15-5. Facing Test

No.	Check point
1	At both sides of the controller and handy remote controller, perform setting and display check.
2	Before starting the check, discuss and determine the air conditioners checking order and procedure.
3	Check 1: Check that the unit name and operation state match between the controller and the handy remote controller.
4	Check 2: Check that the setting operation from the controller can change the setting in the handy remote controller.
5	Check 3: Check that returning the setting to the previous state in the handy remote controller can change the setting in the controller.
6	Proceed to the next air conditioner with check.

15-6. RS-485 Communication Check

No.	Check point
1	At both the Digital Input / Output Relay Interface and the Energy Monitoring Relay Interface, check that the POWER LED1 (Red) is lit and the RS-485 LED2 (Green) is blinking. **Error message** × NG1: The POWER LED1 (Red) is off. — Check if the Digital Input / Output Relay Interface or the Energy Monitoring Relay Interface is turned on. × NG2: The RS-485 LED2 (Green) is off. — Check the RS-485 wiring as shown in the step (2) and the subsequent steps below. ○ OK: The RS-485 LED2 (Green) is blinking. — When the LED2 (Green) is blinking, if S06:BMS-IFWH communication error or S07:BMS-IFDD communication error occurs, perform (6) shown below.
2	Check that the wiring is connected to the RS-485 terminal block of the controller.
3	Check that the wiring is connected to the RS-485 terminal blocks of the Digital Input / Output Relay Interface and the Energy Monitoring Relay Interface.
4	Check that the wiring polarity (+), (-) is correct.
5	Check that the address and switch are correctly set for the Digital Input / Output Relay Interface and the Energy Monitoring Relay Interface.
6	Check that the settings in the “System equipment configuration” and “Address Setting” sheets in the setting file match the address setting of the Digital Input / Output Relay Interface or the Energy Monitoring Relay Interface.

15-7. Checking on RS-485 Send and Receive Circuit of the Controller and Interface

No.	Check point
1	Check that the RS-485 LED2 (Green) of the interface is blinking. **Error message** ○ OK: The RS-485 send circuit of the controller is normal. The RS-485 receive circuit of the interface is normal.

<table>
<tr><th>No.</th><th>Check point</th></tr>
<tr><td>2</td><td>Check the RS-485 send circuit of the interface.
<table>
<tr><th>Error message</th></tr>
<tr><td>Enable the test mode 2 at the interface, and check that communication waveform is output between A and B of the RS-485 terminal block of the interface.</td></tr>
<tr><td>○ OK:
The RS-485 send circuit of the interface is normal.</td></tr>
</table></td></tr>
<tr><td>3</td><td>Check the RS-485 send circuit of the controller.
<table>
<tr><th>Error message</th></tr>
<tr><td>After checking that the Digital Input / Output Relay Interface or the Energy Monitoring Relay Interface is set in the setting file, check that communication waveform is output between A and B of the RS-485 terminal block of the controller.</td></tr>
<tr><td>○ OK:
The RS-485 send circuit of the controller is normal.</td></tr>
</table></td></tr>
</table>

15-8. How to Identify Defective Part at C06 (Receive Failure with TCC-LINK Central Management Device) Occurrence

<table>
<tr><th>No.</th><th>Check point</th></tr>
<tr><td>1</td><td>Check with the handy remote controller if E04 (Indoor and outdoor communication circuit failure) has occurred.
<table>
<tr><th colspan="2">Error message</th></tr>
<tr><td>(If E04 has occurred)</td><td>• Defective part:
TCC-LINK wiring
• Solution:
Check the connection for each outdoor unit system, and identify the defective part (the outdoor system) in the communication wiring.</td></tr>
<tr><td>(If no E04 has occurred)</td><td>• Defective part:
TCC-LINK wiring between the indoor unit and the controller.
• Solution:
Perform the following checks.</td></tr>
</table></td></tr>
<tr><td>2</td><td>Check if the C06 occurred on all the air conditioners or on some of them.
<table>
<tr><th colspan="2">Error message</th></tr>
<tr><td>(When occurred on some of the air conditioners)</td><td>• Defective part:
TCC-LINK wiring on the air conditioners
• Solution:
Identify the defective part of the communication wiring based on the C06 occurrence location and the schematic, and check the wiring connection state and the continuity.</td></tr>
<tr><td>(When occurred on all of the air conditioners)</td><td>• Defective part:
TCC-LINK wiring on the controller
• Solution:
Check the communication wiring continuity.</td></tr>
</table></td></tr>
<tr><td>3</td><td>Check if the address setting in the setting file matches that of the air conditioner.
<table>
<tr><th>Error message</th></tr>
<tr><td>• Defective part:
The address setting in the setting file or the air conditioner.
• Solution:
Change the address in the setting file or the air conditioner.</td></tr>
</table></td></tr>
</table>

15-9. How to Identify Defective Part at S06 (BMS-IFWH Communication Error) or S07 (BMS-IFDD Communication Error) Occurrence

<table>
<tr><th>No.</th><th>Check point</th></tr>
<tr><td>1</td><td>Check if the RS-485 LED (Green) is blinking at the Energy Monitoring Relay Interface or the Digital Input / Output Relay Interface.
<table>
<tr><th colspan="2">Error message</th></tr>
<tr><td>(If blinking)</td><td>Defective part:
1.The RS-485 send circuit of the interface
2.Duplicate setting of the interface address
3.The RS-485 receive circuit of the controller</td></tr>
<tr><td>(If the LED is not blinking)</td><td>Defective part:
1.The RS-485 wiring
2.The RS-485 send circuit of the controller
3.The power source or switch setting of the interface.
4.The RS-485 receive circuit of the interface</td></tr>
</table></td></tr>
<tr><td>2</td><td>Check that S06 or S07 has occurred on all the interfaces.
<table>
<tr><th colspan="2">Error message</th></tr>
<tr><td>(When they have occurred on some of the interfaces)</td><td>• Defective part:
The RS-485 wiring on the interfaces
• Solution:
Identify the defective part of the communication wiring based on the S06 or S07 occurrence location and the schematic, and check the communication wiring connection state, continuity, and polarity.</td></tr>
<tr><td>(When they have occurred on all of the air conditioners)</td><td>• Defective part:
The RS-485 wiring on the controller
• Solution:
Check the communication wiring continuity and polarity.</td></tr>
</table></td></tr>
</table>
